CSE 484 / CSE M 584: Computer Security and Privacy

Mobile Platform Security

Spring 2016

Franziska (Franzi) Roesner franzi@cs.washington.edu

Thanks to Dan Boneh, Dieter Gollmann, Dan Halperin, Yoshi Kohno, John Manferdelli, John Mitchell, Vitaly Shmatikov, Bennet Yee, and many others for sample slides and materials ...

Admin

- **Today:** finish biometrics, start mobile security
- Friday:
 - Lab #2 due (8pm)
 - Guest lecture: Charlie Reis, Google Chrome Security (and UW PhD grad)
- Interested in policy?
 - Thursdays @ 12:30pm, Tech Policy Lunch in the Tech Policy Lab (Law School, room 222)
 - emcr@u.washington.edu

What About Biometrics?

- Authentication: What you are
- Unique identifying characteristics to authenticate user or create credentials
 - Biological and physiological: Fingerprints, iris scan
 - Behaviors characteristics how perform actions: Handwriting, typing, gait
- Advantages:
 - Nothing to remember
 - Passive
 - Can't share (generally)
 - With perfect accuracy, could be fairly unique

Issues with Biometrics

- Private, but not secret
 - Maybe encoded on the back of an ID card?
 - Maybe encoded on your glass, door handle, ...
 - Sharing between multiple systems?
- Revocation is difficult (impossible?)
 - Sorry, your iris has been compromised, please create a new one...
- Physically identifying
 - Soda machine to cross-reference fingerprint with DMV?
- Birthday paradox
 - With false accept rate of 1 in a million, probability of false match is above 50% with only 1609 samples

Attacking Biometrics

- An adversary might try to steal biometric info
 - Malicious fingerprint reader
 - Consider when biometric is used to derive a cryptographic key
 - Residual fingerprint on a glass
- Ex: Apple's TouchID

Security. Right at your fingertip.

Your fingerprint is the perfect password. You always have it with you. And no one can ever guess what it is. Our breakthrough Touch ID technology uses a unique fingerprint identity sensor to make unlocking your phone easy and secure. And with new developments in iOS 8 and Touch ID, your fingerprint will grant you faster access to so much more. COMPlete ich ID is ready. Your print can be i for unlocking your iPhone.

MOBILE PLATFORM SECURITY

Roadmap

- Mobile malware
- Mobile platforms vs. traditional platforms
- Deep dive into Android
 - Continued next Monday
 - Background for Lab #3

Questions: Mobile Malware

Q1: How might malware authors get malware onto phones?

Q2: What are some goals that mobile device malware authors might have?

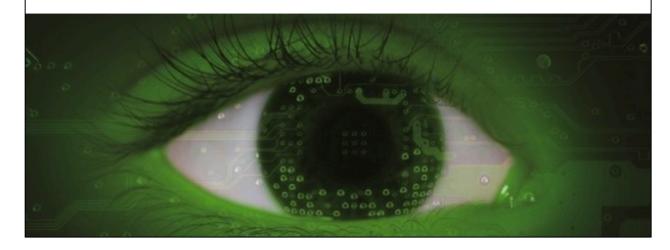

Q3: What technical things might malware authors do?

Smartphone (In)Security

Users accidentally install malicious applications.

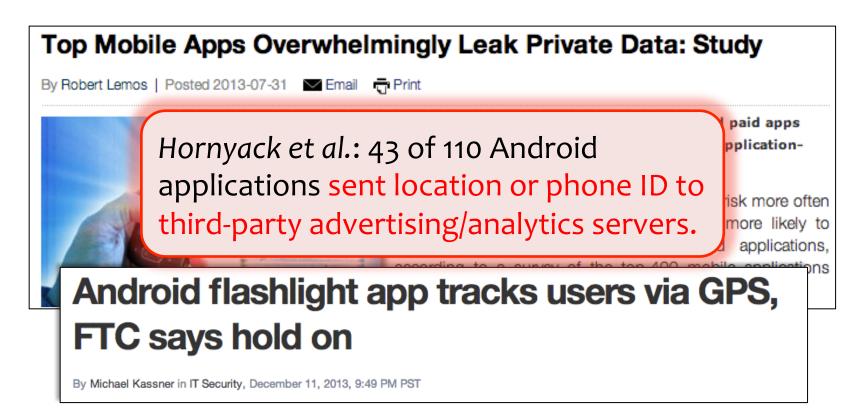

Over 60% of Android malware steals your money via premium SMS, hides in fake forms of popular apps

By Emil Protalinski, Friday, 5 Oct '12 , 05:50pm

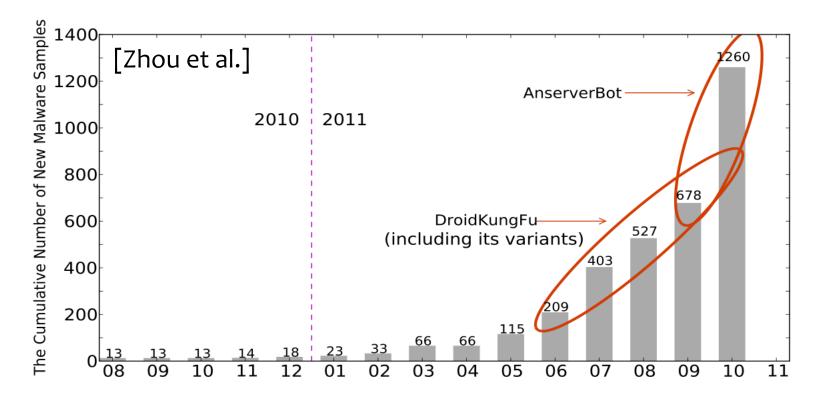

Smartphone (In)Security

Even legitimate applications exhibit questionable behavior.

Malware in the Wild

Android malware is growing. Today (2016): millions of samples.

Mobile Malware Attack Vectors

- Unique to phones:
 - Premium SMS messages
 - Identify location
 - Record phone calls
 - Log SMS
- Similar to desktop/PCs:
 - Connects to botmasters
 - Steal data
 - Phishing
 - Malvertising

Mobile Malware Examples

- **DroidDream** (Android)
 - Over 58 apps uploaded to Google app market
 - Conducts data theft; send credentials to attackers
- Zitmo (Symbian, BlackBerry, Windows, Android)
 - Poses as mobile banking application
 - Captures info from SMS steal banking 2nd factors
 - Works with Zeus botnet
- Ikee (iOS)
 - Worm capabilities (targeted default ssh password)
 - Worked only on jailbroken phones with ssh installed

Mobile Malware Examples

"ikee is never going to give you up"

[Zhou et al.]

(Android) Malware in the Wild

What does it do?

	Root Exploit	Remote Control		Financial Charges			Information Stealing		
		Net	SMS	Phone Call	SMS	Block SMS	SMS	Phone #	User Account
# Families	20	27	1	4	28	17	13	15	3
# Samples	1204	1171	1	256	571	315	138	563	43

Why all these problems with mobile malware?

Background: Before Mobile Platforms

Assumptions in traditional OS (e.g., Linux) design:

- 1. There may be multiple users who don't trust each other.
- 2. Once an application is installed, it's (more or less) trusted.

Background: Before Mobile Platforms

Assumptions in traditional OS (e.g., Linux) design:

- 1. There may be multiple users who don't trust each other.
- 2. Once an application is installed, it's (more or less) trusted.

```
FranziBook:Desktop franzi$ whoami franzi
```

```
FranziBook:Desktop franzi$ id

02(access_bpf),12(everyone),61(localaccounts),79(_appserverusr),80(admin),81(_apps
erveradm),98(_lpadmin),33(_appstore),100(_lpoperator),204(_developer),395(com.appl
e.access_ftp),398(com.apple.access_screensharing),399(com.apple.access_ssh)
```

```
FranziBook:Desktop franzi$ ls -l hello.txt
-rw-r--r-- 1 franzi staff 0 Nov 29 10:08 hello.txt
```

```
FranziBook:Desktop franzi$ chmod 700 hello.txt
FranziBook:Desktop franzi$ ls -l hello.txt
-rwx----- 1 franzi staff 0 Nov 29 10:08 hello.txt
```

Background: Before Mobile Platforms

Assumptions in traditional OS (e.g., Linux) design:

- 1. There may be multiple users who don't trust each other.
- 2. Once an application is installed, it's (more or less) trusted.

Apps can do anything the UID they're running under can do.

What's Different about Mobile Platforms?

- Applications are isolated
 - Each runs in a separate execution context
 - No default access to file system, devices, etc.
 - Different than traditional OSes where multiple applications run with the same user permissions!
- App Store: approval process for applications
 - Market: Vendor controlled/Open
 - App signing: Vendor-issued/self-signed
 - User approval of permissions

More Details: Android

- Based on Linux
- Application sandboxes
 - Applications run as separate UIDs, in separate processes.
 - Memory corruption errors only lead to

Installed Applications System Display **Applications** Application Application Application Application Application Application Application Bluetooth **GPS** DVM DVM DVM DVM DVM DVM DVM Receiver Cellular **Binder** Radio **Embedded Linux**

arbitrary code execution in the context of the **particular** application, not complete system compromise!

– (Can still escape sandbox – but must compromise Linux kernel to do so.) ← allows rooting

[Enck et al.]

Android Applications

- Activities provide user interfaces.
- Services run in the background.
- BroadcastReceivers receive messages sent to multiple applications (e.g., BOOT_COMPLETED).
- ContentProviders are databases addressable by their application-defined URIs.
- AndroidManifest.xml
 - Specifies application components
 - Specifies required permissions

Rooting and Jailbreaking

- Allows user to run applications with root privileges
 - e.g., modify/delete system files, app management, CPU management, network management, etc.
- Done by exploiting vulnerability in firmware to install su binary.
- Double-edged sword...
- Note: iOS is more restrictive than Android
 - Doesn't allow "side-loading" apps, etc.

Challenges with Isolated Apps

So mobile platforms isolate applications for security, but...

- 1. Permissions: How can applications access sensitive resources?
- 2. Communication: How can applications communicate with each other?

(1) Permission Granting Problem

Smartphones (and other modern OSes) try to prevent such attacks by limiting applications' access to:

- System Resources (clipboard, file system).
- Devices (camera, GPS, phone, ...).

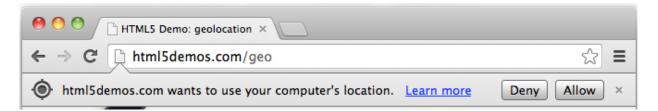

How should operating system grant permissions to applications?

Standard approach: Ask the user.

State of the Art

Prompts (time-of-use)

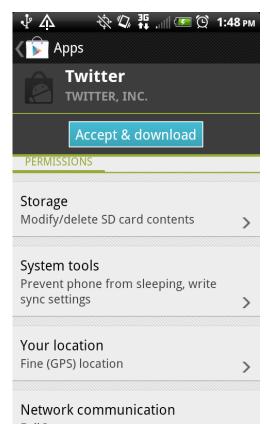

State of the Art

Prompts (time-of-use)

Manifests (install-time)

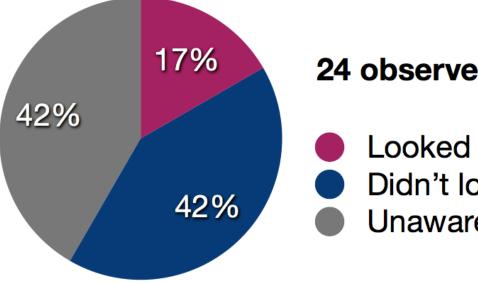

State of the Art

Prompts (time-of-use)	Manifests (install-time)				
Disruptive, which leads to prompt-fatigue.	 ◆ ▲ ▲ ● ● ● ●				
In practice, both are overly pe					
Once granted permissions, app	os can misuse them.				
← → C					
• html5demos.com wants to use your computer's location. Learn	Your location Fine (GPS) location				
	Network communication				

Are Manifests Usable?

Do users pay attention to permissions?

24 observed installations

Looked at permissions Didn't look, but aware Unaware of permissions

... but 88% of users looked at reviews.

Are Manifests Usable?

Do users understand the warnings?

	Permission	n	Correct Answers	
1 Choice	READ_CALENDAR	101	46	45.5%
	CHANGE_NETWORK_STATE	66	26	39.4%
	READ_SMS1	77	24	31.2%
	CALL_PHONE	83	16	19.3%
2 Choices	WAKE_LOCK	81	27	33.3%
	WRITE_EXTERNAL_STORAGE	92	14	15.2%
	READ_CONTACTS	86	11	12.8%
	INTERNET	109	12	11.0%
	READ_PHONE_STATE	85	4	4.7%
	READ_SMS ₂	54	12	22.2%
4	CAMERA	72	7	9.7%

Table 4: The number of people who correctly answered a question. Questions are grouped by the number of correct choices. n is the number of respondents. (Internet Survey, n = 302)

Are Manifests Usable?

Do users act on permission information?

"Have you ever not installed an app because of permissions?"

Over-Permissioning

- Android permissions are badly documented.
- Researchers have mapped APIs \rightarrow permissions.

www.android-permissions.org (Felt et al.), <u>http://pscout.csl.toronto.edu</u> (Au et al.)
