

# **CSE 484 / CSE M 584: Web Security: Certificates and Browser Security Model**

Fall 2022

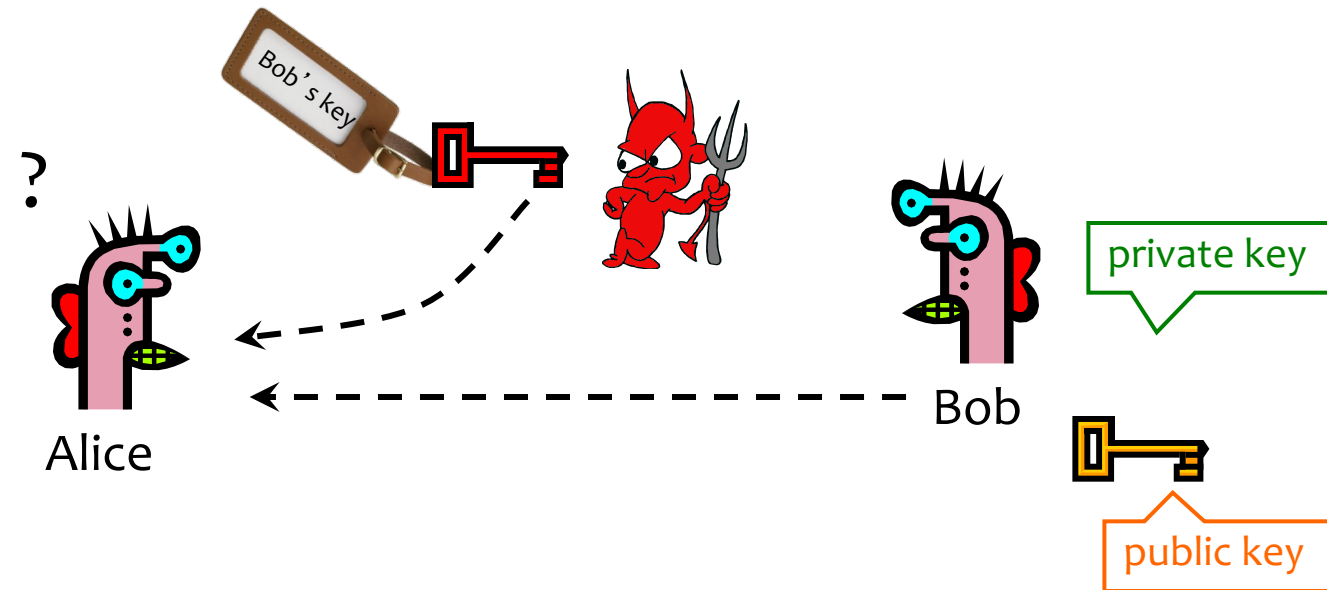

Franziska (Franzi) Roesner  
franzi@cs

UW Instruction Team: David Kohlbrenner, Yoshi Kohno, Franziska Roesner. Thanks to Dan Boneh, Dieter Gollmann, Dan Halperin, John Manferdelli, John Mitchell, Vitaly Shmatikov, Bennet Yee, and many others for sample slides and materials ...

# Announcements

- Homework 2 due in 1 week
- Lab 2 (web security) out likely next week

# Review: Authenticity of Public Keys

Problem: How does Alice know that the public key she received is really Bob's public key?

# Review: Distribution of Public Keys

- Public announcement or public directory
  - Risks: forgery and tampering
- Public-key certificate
  - Signed statement specifying the key and identity
    - $\text{sig}_{\text{CA}}(\text{"Bob"}, \text{PK}_B)$
- Common approach: certificate authority (CA)
  - Single agency responsible for certifying public keys
  - After generating a private/public key pair, user proves his identity and knowledge of the private key to obtain CA's certificate for the public key (offline)
  - Every computer is pre-configured with CA's public key

# You encounter this every day...

**SSL/TLS:** Encryption & authentication for connections

# SSL/TLS High Level

- SSL/TLS consists of **two** protocols
  - Familiar pattern for key exchange protocols
- Handshake protocol
  - Use **public-key cryptography** to establish a shared secret key between the client and the server
- Record protocol
  - Use the **secret symmetric key** established in the handshake protocol to protect communication between the client and the server

# Example of a Certificate

GeoTrust Global CA  
↳ Google Internet Authority G2  
↳ \*.google.com

 **\*.google.com**  
Issued by: Google Internet Authority G2  
Expires: Monday, July 6, 2015 at 5:00:00 PM Pacific Daylight Time  
✔ This certificate is valid

▼ **Details**

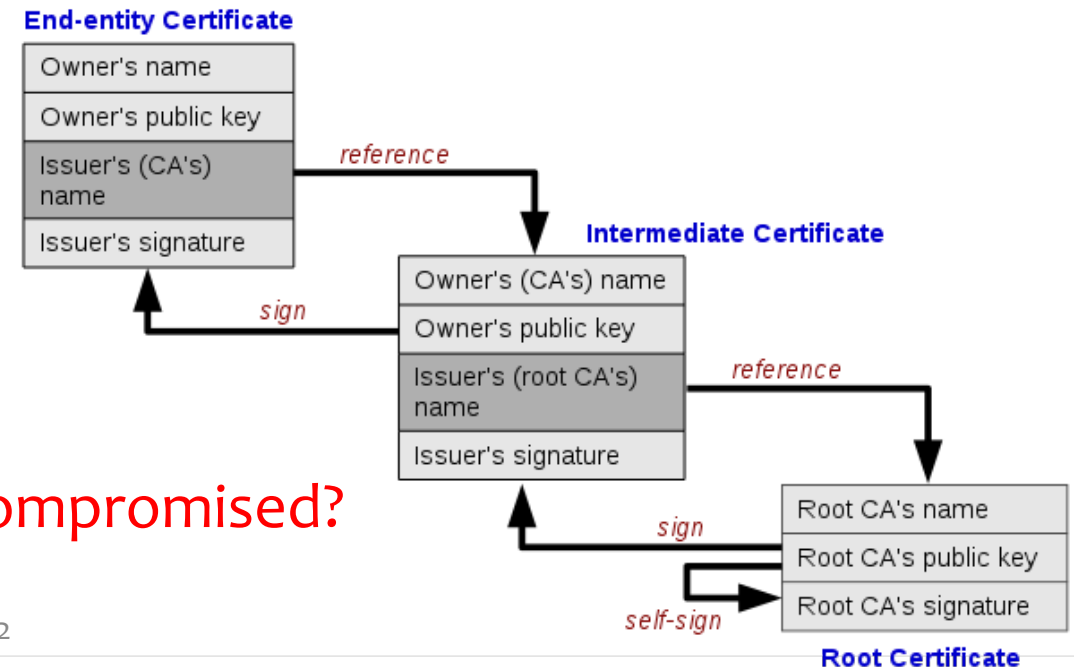

<b>Subject Name</b>	
<b>Country</b>	US
<b>State/Province</b>	California
<b>Locality</b>	Mountain View
<b>Organization</b>	Google Inc
<b>Common Name</b>	*.google.com
<b>Issuer Name</b>	
<b>Country</b>	US
<b>Organization</b>	Google Inc
<b>Common Name</b>	Google Internet Authority G2
<b>Serial Number</b>	6082711391012222858
<b>Version</b>	3

<b>Signature Algorithm</b>	SHA-1 with RSA Encryption ( 1.2.840.113549.1.1.5 )
<b>Parameters</b>	none
<b>Not Valid Before</b>	Wednesday, April 8, 2015 at 6:40:10 AM Pacific Daylight Time
<b>Not Valid After</b>	Monday, July 6, 2015 at 5:00:00 PM Pacific Daylight Time
<b>Public Key Info</b>	
<b>Algorithm</b>	Elliptic Curve Public Key ( 1.2.840.10045.2.1 )
<b>Parameters</b>	Elliptic Curve secp256r1 ( 1.2.840.10045.3.1.7 )
<b>Public Key</b>	65 bytes : 04 CB DD C1 CE AC D6 20 ...
<b>Key Size</b>	256 bits
<b>Key Usage</b>	Encrypt, Verify, Derive
<b>Signature</b>	256 bytes : 34 8B 7D 64 5A 64 08 5B ...

# Hierarchical Approach

- Single CA certifying every public key is impractical
- Instead, use a trusted **root authority** (e.g., Verisign)
  - Everybody must know the root's public key
  - Instead of single cert, use a **certificate chain**
    - $\text{sig}_{\text{Verisign}}(\text{"AnotherCA"}, \text{PK}_{\text{AnotherCA}})$ ,  
 $\text{sig}_{\text{AnotherCA}}(\text{"Alice"}, \text{PK}_A)$
  - Not shown in figure but important:
    - Signed as part of each cert is whether party is a CA or not

– What happens if root authority is ever compromised?

# Trusted(?) Certificate Authorities

# Turtles All The Way Down...

The saying holds that the world is supported by a chain of increasingly large turtles. Beneath each turtle is yet another: it is "turtles all the way down".

[Image from Wikipedia]

# Many Challenges...

- Hash collisions
- Weak security at CAs
  - Allows attackers to issue rogue certificates
- Users don't notice when attacks happen
  - We'll talk more about this later in the course
- How do you revoke certificates?

# Colliding Certificates

DigiNotar is a Dutch Certificate Authority. They sell SSL certificates.

## Attacking CAs

### Security of DigiNotar servers:

- All core certificate servers controlled by a single admin password (Prod@dm1n)
- Software on public-facing servers out of date, unpatched
- No anti-virus (could have detected attack)

Somehow, somebody managed to get a rogue SSL certificate from them on **July 10th, 2011**. This certificate was issued for domain name **.google.com**.

What can you do with such a certificate? Well, you can impersonate Google — assuming you can first reroute Internet traffic for google.com to you. This is something that can be done by a government or by a rogue ISP. Such a reroute would only affect users within that country or under that ISP.

# Consequences

- Attacker needs to first divert users to an attacker-controlled site instead of Google, Yahoo, Skype, but then...
  - For example, use DNS to poison the mapping of mail.yahoo.com to an IP address
- ... “authenticate” as the real site
- ... decrypt all data sent by users
  - Email, phone conversations, Web browsing

# More Rogue Certs

- In Jan 2013, a rogue \*.google.com certificate was issued by an intermediate CA that gained its authority from the Turkish root CA TurkTrust
  - TurkTrust accidentally issued intermediate CA certs to customers who requested regular certificates
  - Ankara transit authority used its certificate to issue a fake \*.google.com certificate in order to filter SSL traffic from its network
- This rogue \*.google.com certificate was trusted by every browser in the world
- There are plenty more stories like this...

# Certificate Revocation

- Revocation is very important
- Many valid reasons to revoke a certificate
  - Private key corresponding to the certified public key has been compromised
  - User stopped paying their certification fee to this CA and CA no longer wishes to certify them
  - CA's private key has been compromised!
- Expiration is a form of revocation, too
  - Many deployed systems don't bother with revocation
  - Re-issuance of certificates is a big revenue source for certificate authorities

# Certificate Revocation Mechanisms

- Certificate revocation list (CRL)
  - CA periodically issues a signed list of revoked certificates
    - Credit card companies used to issue thick books of canceled credit card numbers
  - Can issue a “delta CRL” containing only updates
- Online revocation service
  - When a certificate is presented, recipient goes to a special online service to verify whether it is still valid
    - Like a merchant dialing up the credit card processor

Attempt to Fix CA Problems:

# Certificate Transparency

- **Problem:** browsers will think nothing is wrong with a rogue certificate until revoked
- **Goal:** make it impossible for a CA to issue a bad certificate for a domain *without the owner of that domain knowing*
- **Approach:** auditable certificate logs
  - Certificates published in public logs
  - Public logs checked for unexpected certificates

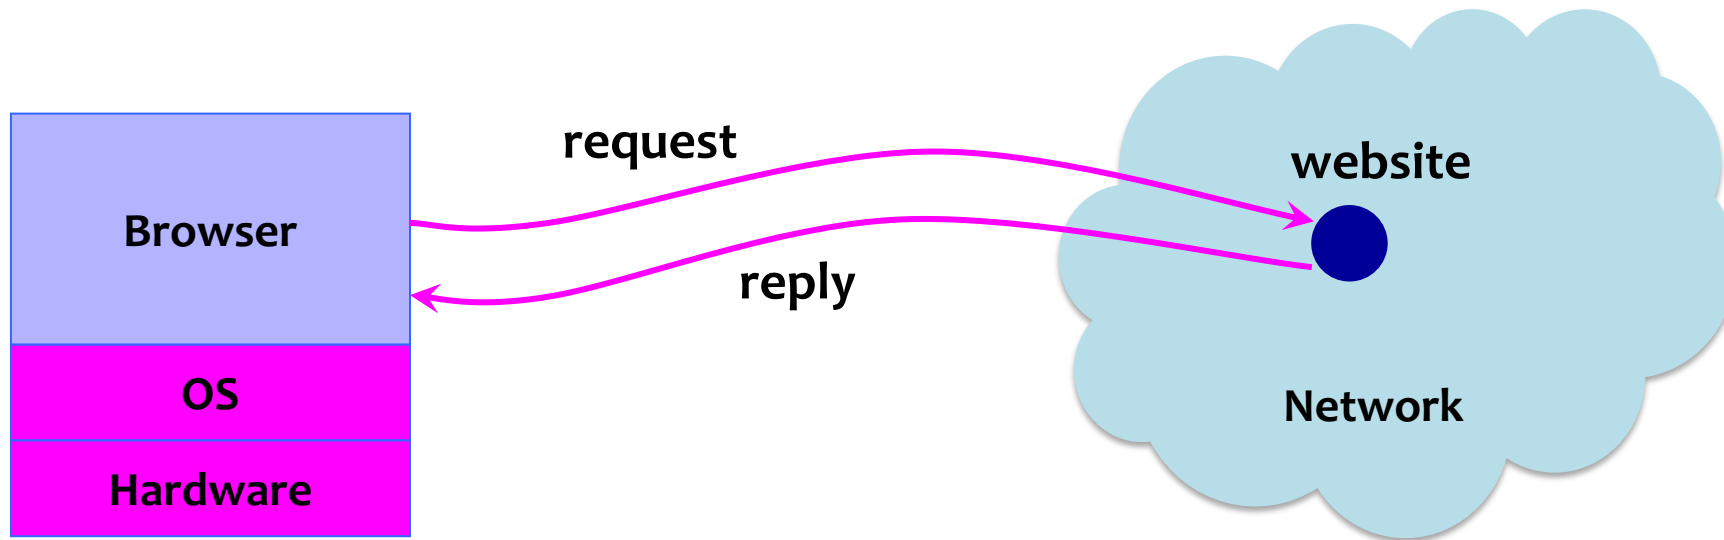

[www.certificate-transparency.org](http://www.certificate-transparency.org)

## Attempt to Fix CA Problems:

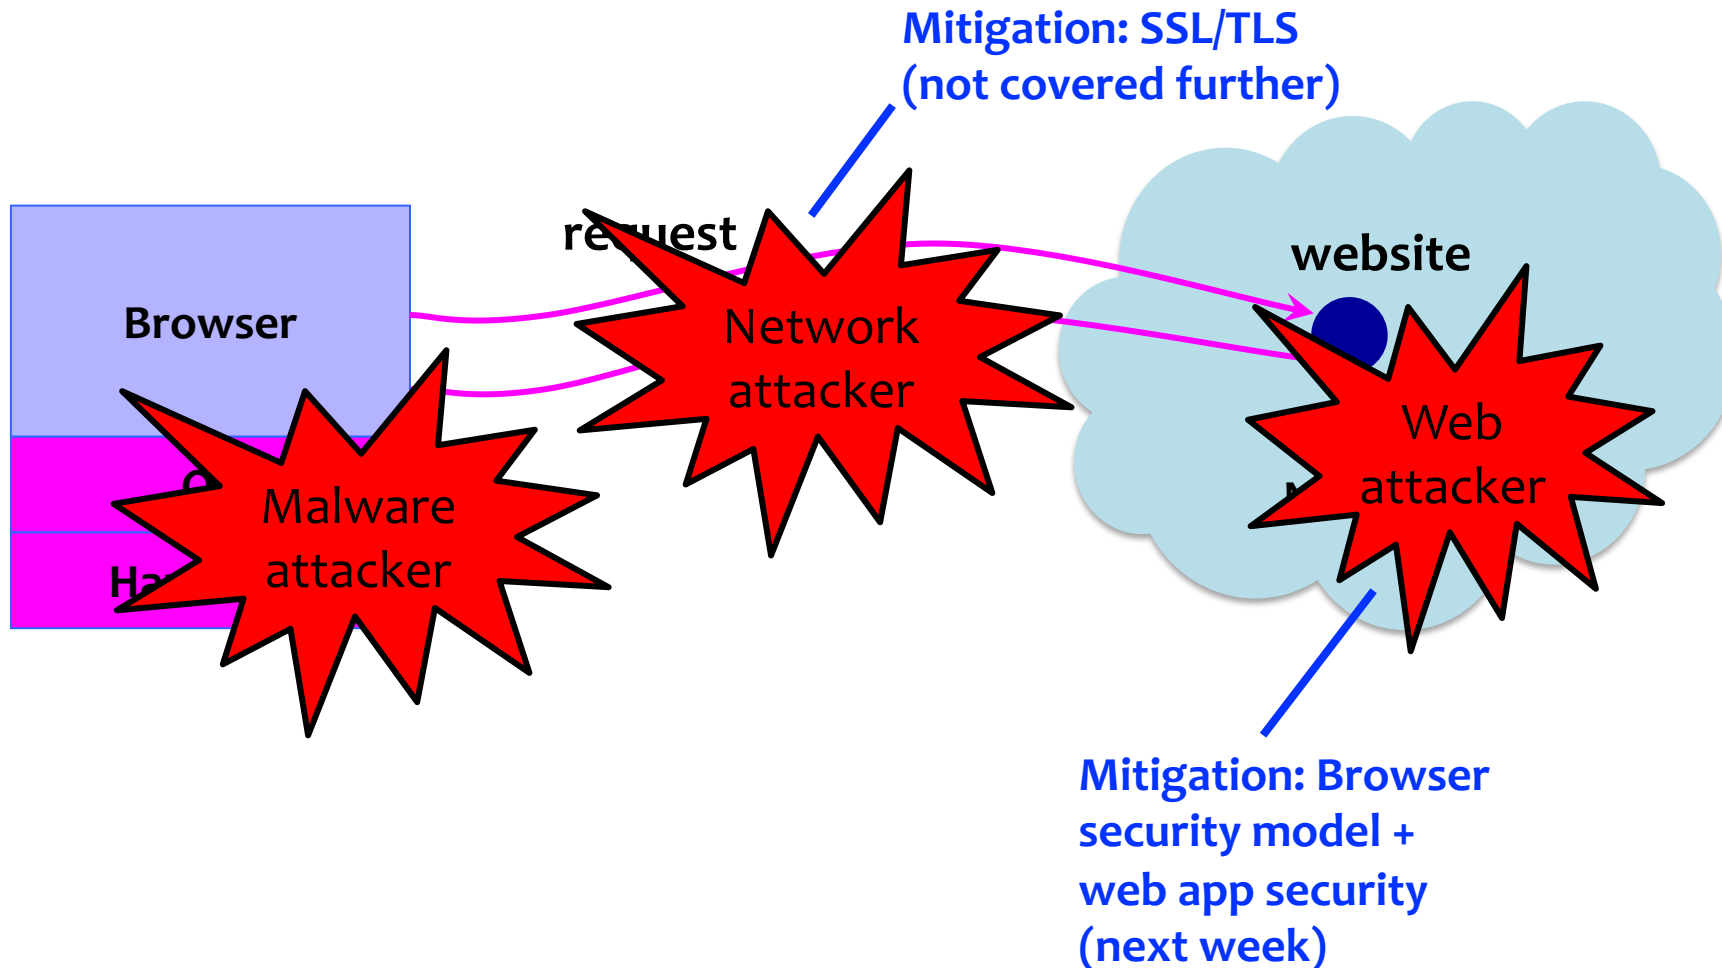

# Certificate Pinning

- **Trust on first access:** tells browser how to act on subsequent connections
- HPKP – HTTP Public Key Pinning
  - Use these keys!
  - HTTP response header field `Public-Key-Pins`
- HSTS – HTTP Strict Transport Security
  - Only access server via HTTPS
  - HTTP response header field `Strict-Transport-Security`

# Big Picture: Browser and Network

# Where Does the Attacker Live?

# Two Sides of Web Security

## (1) Web browser

- Responsible for securely confining content presented by visited websites

## (2) Web applications

- Online merchants, banks, blogs, Google Apps ...
- Mix of server-side and client-side code
  - Server-side code written in PHP, JavaScript, C++ etc.
  - Client-side code written in JavaScript (... sort of)
- Many potential bugs: XSS, XSRF, SQL injection

# But at least 3 actors!

# Browser: All of These Should Be Safe

- Safe to visit an evil website
- Safe to visit two pages
  - Simultaneously
  - Sequentially
- Safe delegation

# Browser Security Model

Goal 1: Protect local system from web attacker

→ Browser Sandbox

Goal 2: Protect/isolate web content from other web content

→ Same Origin Policy
