

CSE 490 GZ

Introduction to Data Compression

Winter 2002

Course Policies
Introduction to Data Compression
Entropy
Prefix Codes

Instructors

- Instructor
 - Richard Ladner
 - ladner@cs.washington.edu
 - 206 543-9347
 - office hours: WTh 11-12
- TA
 - Justin Goshi
 - goshi@cs.washington.edu
 - office hours - TBA

CSE 490gz - Lecture 1 - Winter 2002

2

Prerequisites

- CSE 142, 143
- CSE 326 or CSE 373
- Reason for the prerequisites:
 - Data compression has many algorithms
 - Some of the algorithms require complex data structures

CSE 490gz - Lecture 1 - Winter 2002

3

Resources

- Text Book
 - Khalid Sayood, Introduction to Data Compression, Second Edition, Morgan Kaufmann Publishers, 2000.
- 490gz Course Web Page
 - <http://www.cs.washington.edu/490gz/>
- Papers and Sections from Books
- E-mail list
 - Send mail to majordomo to subscribe

CSE 490gz - Lecture 1 - Winter 2002

4

Engagement by Students

- Weekly Assignments
 - Understand compression methodology
 - Due in class on Fridays (except midterm Friday)
 - No late assignments accepted except with prior approval
- Programming Projects
 - Experimental comparison of compression methods
 - Modification of compression methods.
 - Build a decoder from an encoder.

CSE 490gz - Lecture 1 - Winter 2002

5

Final Exam and Grading

- Final Exam - 8:30-10:20 a.m. Tuesday, March 19, 2002
- Midterm Exam – Friday, February 8, 2002
- Percentages
 - Weekly assignments (25%)
 - Midterm exam (20%)
 - Projects (15%)
 - Final exam (40%)

CSE 490gz - Lecture 1 - Winter 2002

6

Basic Data Compression Concepts

- **Lossless** compression $x = \hat{x}$
 - Also called entropy coding, reversible coding.
- **Lossy** compression $x \neq \hat{x}$
 - Also called irreversible coding.
- **Compression ratio** $= |x|/|y|$
 - $|x|$ is number of bits in x .

CSE 490gz - Lecture 1 - Winter 2002

7

Why Compress

- **Conserve storage space**
- **Reduce time for transmission**
 - Faster to encode, send, then decode than to send the original
- **Progressive transmission**
 - Some compression techniques allow us to send the most important bits first so we can get a low resolution version of some data before getting the high fidelity version
- **Reduce computation**
 - Use less data to achieve an approximate answer

CSE 490gz - Lecture 1 - Winter 2002

8

Braille

- System to read text by feeling raised dots on paper (or on electronic displays). Invented in 1820s by Louis Braille, a French blind man.

a b c z

and the with mother

th ch gh

CSE 490gz - Lecture 1 - Winter 2002

9

Braille Example

Clear text:

Call me Ishmael. Some years ago -- never mind how long precisely -- having little or no money in my purse, and nothing particular to interest me on shore, I thought I would sail about a little and see the watery part of the world. (238 characters)

Grade 2 Braille in ASCII.

,call me ,i%mael4 , 's ye\$>\$s ago -- n' 'e m9d h[l;g precisely -- hav+ \l or no m' 'oy 9 my purse1 \& no?+ ' 'picul\$>\$ 6 9t|e/ me on \%ore1 \ , i \$?' '\$)\$ \$, i wd sail ab a ll \& see ! wat|y ' 'p (! _w4 (203 characters)

Compression ratio = 238/203 = 1.17

CSE 490gz - Lecture 1 - Winter 2002

10

Lossless Compression

- Data is not lost - the original is really needed.
 - text compression
 - compression of computer binaries to fit on a floppy
- Compression ratio typically no better than 4:1 for lossless compression on many kinds of files.
- Statistical Techniques
 - Huffman coding
 - Arithmetic coding
 - Golomb coding
- Dictionary techniques
 - LZW, LZ77
 - Sequitur
 - Burrows-Wheeler Method
- Standards - Morse code, Braille, Unix compress, gzip, zip, bzip, GIF, JBIG, Lossless JPEG

CSE 490gz - Lecture 1 - Winter 2002

11

Lossy Compression

- Data is lost, but not too much.
 - audio
 - video
 - still images, medical images, photographs
- Compression ratios of 10:1 often yield quite high fidelity results.
- Major techniques include
 - Vector Quantization
 - Wavelets
 - Block transforms
 - Standards - JPEG, MPEG

CSE 490gz - Lecture 1 - Winter 2002

12

Why is Data Compression Possible

- Most data from nature has **redundancy**
 - There is more data than the actual information contained in the data.
 - Squeezing out the excess data amounts to compression.
 - However, unsqueezing out is necessary to be able to figure out what the data means.
- Information theory** is needed to understand the limits of compression and give clues on how to compress well.

CSE 490gz - Lecture 1 - Winter 2002

13

Information Theory

- Developed by Shannon in the 1940's and 50's
- Attempts to explain the limits of communication using probability theory.
- Example: Suppose English text is being sent
 - Suppose a "t" is received. Given English, the next symbol being a "z" has very low probability, the next symbol being a "h" has much higher probability. Receiving a "z" has much more information in it than receiving a "h". We already knew it was more likely we would receive an "h".

CSE 490gz - Lecture 1 - Winter 2002

14

First-order Information

- Suppose we are given symbols $\{a_1, a_2, \dots, a_m\}$.
- $P(a_i)$ = probability of symbol a_i occurring in the absence of any other information.
 - $P(a_1) + P(a_2) + \dots + P(a_m) = 1$
- $\inf(a_i) = -\log_2 P(a_i)$ bits is the information of a_i in bits.

CSE 490gz - Lecture 1 - Winter 2002

15

Example

- $\{a, b, c\}$ with $P(a) = 1/8$, $P(b) = 1/4$, $P(c) = 5/8$
 - $\inf(a) = -\log_2(1/8) = 3$
 - $\inf(b) = -\log_2(1/4) = 2$
 - $\inf(c) = -\log_2(5/8) = .678$
- Receiving an "a" has more information than receiving a "b" or "c".

CSE 490gz - Lecture 1 - Winter 2002

16

First Order Entropy

- The first order entropy is defined for a probability distribution over symbols $\{a_1, a_2, \dots, a_m\}$.

$$H = -\sum_{i=1}^m P(a_i) \log_2(P(a_i))$$

- H is the average number of bits required to code up a symbol, given all we know is the probability distribution of the symbols.
- H is the Shannon lower bound on the average number of bits to code a symbol in this "source model".
- Stronger models of entropy include context. We'll talk about this later.

CSE 490gz - Lecture 1 - Winter 2002

17

Entropy Examples

- $\{a, b, c\}$ with a $1/8$, b $1/4$, c $5/8$.
 - $H = 1/8 * 3 + 1/4 * 2 + 5/8 * .678 = 1.3$ bits/symbol
- $\{a, b, c\}$ with a $1/3$, b $1/3$, c $1/3$. (worst case)
 - $H = -3 * (1/3) * \log_2(1/3) = 1.6$ bits/symbol
- $\{a, b, c\}$ with a 1 , b 0 , c 0 (best case)
 - $H = -1 * \log_2(1) = 0$
- Note that the standard coding of 3 symbols takes 2 bits.

CSE 490gz - Lecture 1 - Winter 2002

18

Entropy Curve

- Suppose we have two symbols with probabilities x and $1-x$, respectively.

CSE 490gz - Lecture 1 - Winter 2002

19

A Simple Prefix Code

- $\{a, b, c\}$ with a 1/8, b 1/4, c 5/8.
- A **prefix code** is defined by a binary tree
- Prefix code property**
 - no output is a prefix of another

32

How Good is the Code

bit rate = $(1/8)2 + (1/4)2 + (5/8)1 = 11/8 = 1.375$ bps

Entropy = 1.3 bps

Standard code = 2 bps

(bps = bits per symbol)
