

CSE 490 GZ

Introduction to Data Compression

Winter 2004

Sequitur

Sequitur

- Nevill-Manning and Witten, 1996.
- Uses a context-free grammar (without recursion) to represent a string.
- The grammar is inferred from the string.
- If there is structure and repetition in the string then the grammar may be very small compared to the original string.
- Clever encoding of the grammar yields impressive compression ratios.
- Compression plus structure!

CSE 490gz - Lecture 9 - Winter 2004

2

Context-Free Grammars

- Invented by Chomsky in 1959 to explain the grammar of natural languages.
- Also invented by Backus in 1959 to generate and parse Fortran.
- Example:
 - terminals: b, e
 - non-terminals: S, A
 - Production Rules:
 - $S \rightarrow SA$, $S \rightarrow A$, $A \rightarrow bSe$, $A \rightarrow be$
 - S is the start symbol

CSE 490gz - Lecture 9 - Winter 2004

3

Context-Free Grammar Example

- $S \rightarrow SA$
- $S \rightarrow A$
- $A \rightarrow bSe$
- $A \rightarrow be$

Example: b and e matched as parentheses

CSE 490gz - Lecture 9 - Winter 2004

4

Arithmetic Expressions

- $S \rightarrow S + T$
- $S \rightarrow T$
- $T \rightarrow T * F$
- $T \rightarrow F$
- $F \rightarrow a$
- $F \rightarrow (S)$

derivation of $a * (a + a) + a$

```

S
S+T
T+T
T*F+T
F*F+T
a*F+T
a*(S)+F
a*(S+F)+T
a*(T+F)+T
a*(F+F)+T
a*(a+F)+T
a*(a+a)+T
a*(a+a)+F
a*(a+a)+a
    
```

CSE 490gz - Lecture 9 - Winter 2004

5

Overview of Grammar Compression

CSE 490gz - Lecture 9 - Winter 2004

6

Sequitur Principles

- Digram Uniqueness:
 - no pair of adjacent symbols (digram) appears more than once in the grammar.
- Rule Utility:
 - Every production rule is used more than once.
- These two principles are maintained as an invariant while inferring a grammar for the input string.

CSE 490gz - Lecture 9 - Winter 2004

7

Sequitur Example (1)

bbeebbeebbeeb

$S \rightarrow b$

CSE 490gz - Lecture 9 - Winter 2004

8

Sequitur Example (2)

bbeebbeebbeeb

$S \rightarrow bb$

CSE 490gz - Lecture 9 - Winter 2004

9

Sequitur Example (3)

bbeebbeebbeeb

$S \rightarrow bbe$

CSE 490gz - Lecture 9 - Winter 2004

10

Sequitur Example (4)

bbeebbeebbeeb

$S \rightarrow bbeb$

CSE 490gz - Lecture 9 - Winter 2004

11

Sequitur Example (5)

bbeebbeebbeeb

$S \rightarrow bbebe$

Enforce digram uniqueness.
be occurs twice.
Create new rule $A \rightarrow be$.

CSE 490gz - Lecture 9 - Winter 2004

12

Sequitur Example (6)

bbeeebebbebeee

S → bAA
A → be

CSE 490gz - Lecture 9 - Winter 2004

13

Sequitur Example (7)

bbeeebebbebeee

S → bAAe
A → be

CSE 490gz - Lecture 9 - Winter 2004

14

Sequitur Example (8)

bbeeebbebbebeee

S → bAAeb
A → be

CSE 490gz - Lecture 9 - Winter 2004

15

Sequitur Example (9)

bbeeebebebbebeee

S → bAAebe
A → be

Enforce digram uniqueness.
be occurs twice.
Use existing rule A → be.

CSE 490gz - Lecture 9 - Winter 2004

16

Sequitur Example (10)

bbeeebebebbebeee

S → bAAeA
A → be

CSE 490gz - Lecture 9 - Winter 2004

17

Sequitur Example (11)

bbeeebebbebbebeee

S → bAAeAb
A → be

CSE 490gz - Lecture 9 - Winter 2004

18

Sequitur Example (12)

bbeeebebebbebee

S → bAAeAbe
A → be
Enforce digram uniqueness.
be occurs twice.
Use existing rule A → be.

Sequitur Example (13)

bbeeebebebbebee

S → bAAeAA
A → be
Enforce digram uniqueness
AA occurs twice.
Create new rule B → AA.

Sequitur Example (14)

bbeeebebebbebee

S → bBeB
A → be
B → AA

Sequitur Example (15)

bbeeebebebbbebee

S → bBeBb
A → be
B → AA

Sequitur Example (16)

bbeeebebebbbbebee

S → bBeBbb
A → be
B → AA

Sequitur Example (17)

bbeeebebebbebbebee

S → bBeBbbe
A → be
B → AA
Enforce digram uniqueness.
be occurs twice.
Use existing rule A → be.

Sequitur Example (18)

bbeeeebbebbebee

S → bBeBbA
A → be
B → AA

Sequitur Example (19)

bbeeeebbebbebee

S → bBeBbAb
A → be
B → AA

Sequitur Example (20)

bbeeeebbebbebee

S → bBeBbA**be** Enforce digram uniqueness.
A → **be** be occurs twice.
B → AA Use existing rule A → be.

Sequitur Example (21)

bbeeeebbebbebee

S → bBeBb**AA** Enforce digram uniqueness.
A → be AA occurs twice.
B → **AA** Use existing rule B → AA.

Sequitur Example (22)

bbeeeebbebbebee

S → **bBeBbB** Enforce digram uniqueness.
A → be bB occurs twice.
B → AA Create new rule C → bB.

Sequitur Example (23)

bbeeeebbebbebee

S → CeBC
A → be
B → AA
C → bB

Sequitur Example (24)

bbeebbebbee

$S \rightarrow CeBCe$ Enforce digram uniqueness.
 $A \rightarrow be$ Ce occurs twice.
 $B \rightarrow AA$ Create new rule $D \rightarrow Ce$.
 $C \rightarrow bB$

CSE 490gz - Lecture 9 - Winter 2004

31

Sequitur Example (25)

bbeebbebbee

$S \rightarrow DBD$ Enforce rule utility.
 $A \rightarrow be$ C occurs only once.
 $B \rightarrow AA$ Remove $C \rightarrow bB$.
 $C \rightarrow bB$
 $D \rightarrow Ce$

CSE 490gz - Lecture 9 - Winter 2004

32

Sequitur Example (26)

bbeebbebbee

$S \rightarrow DBD$
 $A \rightarrow be$
 $B \rightarrow AA$
 $D \rightarrow bBe$

CSE 490gz - Lecture 9 - Winter 2004

33

The Hierarchy

bbeebbebbee

$S \rightarrow DBD$
 $A \rightarrow be$
 $B \rightarrow AA$
 $D \rightarrow bBe$

Is there compression? In this small example, probably not.

CSE 490gz - Lecture 9 - Winter 2004

34

Sequitur Algorithm

Input the first symbol s to create the production $S \rightarrow s$;
 repeat
 match an existing rule:
 $A \rightarrow \dots XY \dots$ $A \rightarrow \dots B \dots$
 $B \rightarrow XY$ $B \rightarrow XY$
 create a new rule:
 $A \rightarrow \dots XY \dots$ $A \rightarrow \dots C \dots$
 $B \rightarrow \dots XY \dots$ $B \rightarrow \dots C \dots$
 $C \rightarrow XY$
 remove a rule:
 $A \rightarrow \dots B \dots$
 $B \rightarrow X_1 X_2 \dots X_k$ $A \rightarrow \dots X_1 X_2 \dots X_k \dots$
 input a new symbol:
 $S \rightarrow X_1 X_2 \dots X_k$ $S \rightarrow X_1 X_2 \dots X_k s$
 until no symbols left

CSE 490gz - Lecture 9 - Winter 2004

35

Exercise

Use Sequitur to construct a grammar for $aaaaaaaaa = a^{10}$

CSE 490gz - Lecture 9 - Winter 2004

36

Complexity

- The number of non-input sequitur operations applied $< 2n$ where n is the input length.
- Since each operation takes constant time, sequitur is a linear time algorithm

CSE 490gz - Lecture 9 - Winter 2004

37

Amortized Complexity Argument

- Let $m = \#$ of non-input sequitur operations.
Let $n =$ input length. Show $m \leq 2n$.
- Let $s =$ the sum of the right hand sides of all the production rules. Let $r =$ the number of rules.
- We evaluate $2s - r$.
- Initially $2s - r = 1$ because $s = 1$ and $r = 1$.
- $2s - r > 0$ at all times because each rule has at least 1 symbol on the right hand side.

CSE 490gz - Lecture 9 - Winter 2004

38

Sequitur Rule Complexity

- Digram Uniqueness - match an existing rule.

$$\begin{array}{l} A \rightarrow \dots XY \dots \\ B \rightarrow XY \end{array} \rightarrow \begin{array}{l} A \rightarrow \dots B \dots \\ B \rightarrow XY \end{array} \quad \begin{array}{cc} s & r \\ -1 & 0 \end{array} \quad \begin{array}{c} 2s - r \\ -2 \end{array}$$

- Digram Uniqueness - create a new rule.

$$\begin{array}{l} A \rightarrow \dots XY \dots \\ B \rightarrow \dots XY \dots \end{array} \rightarrow \begin{array}{l} A \rightarrow \dots C \dots \\ B \rightarrow \dots C \dots \\ C \rightarrow XY \end{array} \quad \begin{array}{cc} s & r \\ 0 & 1 \end{array} \quad \begin{array}{c} 2s - r \\ -1 \end{array}$$

- Rule Utility - Remove a rule.

$$\begin{array}{l} A \rightarrow \dots B \dots \\ B \rightarrow X_1 X_2 \dots X_k \end{array} \rightarrow \begin{array}{l} A \rightarrow \dots X_1 X_2 \dots X_k \dots \end{array} \quad \begin{array}{cc} s & r \\ -1 & -1 \end{array} \quad \begin{array}{c} 2s - r \\ -1 \end{array}$$

CSE 490gz - Lecture 9 - Winter 2004

39

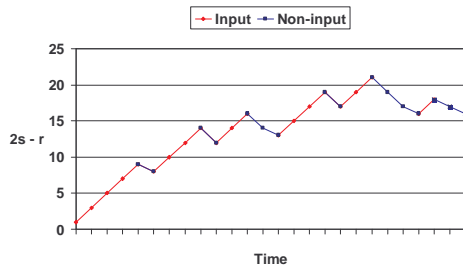

Amortized Complexity Argument

- $2s - r \geq 0$ at all times because each rule has at least 1 symbol on the right hand side.
- $2s - r$ increases by 2 for every input operation.
- $2s - r$ decreases by at least 1 for each non-input sequitur rule applied.
- $n =$ number of input symbols
 $m =$ number of non-input operations
- $2n - m \geq 0$. $m \leq 2n$.

CSE 490gz - Lecture 9 - Winter 2004

40

Amortized Complexity Argument

CSE 490gz - Lecture 9 - Winter 2004

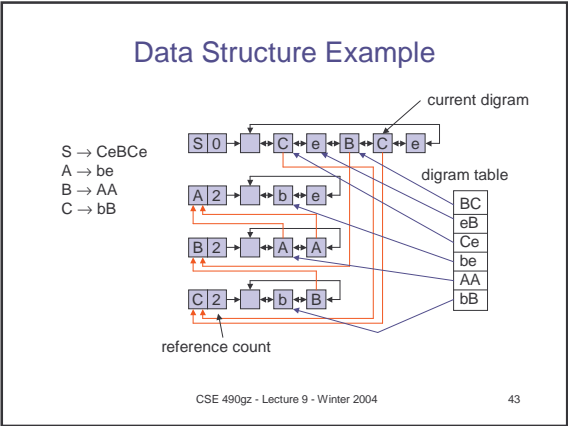

41

Linear Time Algorithm

- There is a data structure to implement all the sequitur operations in constant time.
 - Production rules in an array of doubly linked lists.
 - Each production rule has reference count of the number of times used.
 - Each nonterminal points to its production rule.
 - Digrams stored in a hash table for quick lookup.

CSE 490gz - Lecture 9 - Winter 2004

42

Basic Encoding a Grammar

Grammar: $S \rightarrow DBD$, $A \rightarrow be$, $B \rightarrow AA$, $D \rightarrow bBe$

Symbol Code	b	000	
	e	001	No code for S needed
	A	010	
	B	011	
	D	100	
	#	101	

Grammar Code

$D B D \# b e \# A A \# b B e$
 100 011 100 101 000 001 101 010 010 101 000 011 001 39 bits

$$[\text{Grammar Code}] = (s + r - 1) \lceil \log_2(r + a) \rceil$$

r = number of rules
 s = sum of right hand sides
 a = number in original symbol alphabet

CSE 490gz - Lecture 9 - Winter 2004 44

- ### Better Encoding of the Grammar
- Nevill-Manning and Witten suggest a more efficient encoding of the grammar that uses LZ77 ideas.
 - Send the right hand side of the S production.
 - The first time a nonterminal is sent, its right hand side is transmitted instead.
 - The second time a nonterminal is sent as a triple $[i, j, d]$, which says the right hand side starts at position j in production rule i and is d long. A new production rule is then added to a dictionary.
 - Subsequently, the nonterminal is represented by the index of the production rule.
- CSE 490gz - Lecture 9 - Winter 2004 45

Transmission Example

$S \rightarrow tAABCa$
 $A \rightarrow BBB$
 $B \rightarrow Ct$
 $C \rightarrow ag$

$T = \text{Transmitted}$
 $T \text{ tagt}$
 $X_0 \text{ tagt}$ $l_0 = 4$

CSE 490gz - Lecture 9 - Winter 2004 46

Transmission Example

$S \rightarrow tAABCa$
 $A \rightarrow BBB$
 $B \rightarrow Ct$
 $C \rightarrow ag$

$T = \text{Transmitted}$
 $T \text{ tagt}[0, 1, 3]$
 $X_0 \text{ t} X_1 X_1$ $l_0 = 3$
 $X_1 \text{ agt}$ $l_1 = 3$

CSE 490gz - Lecture 9 - Winter 2004 47

Transmission Example

$S \rightarrow tAABCa$
 $A \rightarrow BBB$
 $B \rightarrow Ct$
 $C \rightarrow ag$

$T = \text{Transmitted}$
 $T \text{ tagt}[0, 1, 3] 1$
 $X_0 \text{ t} X_1 X_1 X_1$ $l_0 = 4$
 $X_1 \text{ agt}$ $l_1 = 3$

CSE 490gz - Lecture 9 - Winter 2004 48

Transmission Example

S → tAABCa
A → BBB
B → Ct
C → ag

T = Transmitted
T tagt[0, 1, 3] 1 [0, 1, 3]

X₀ tX₂X₂ l₀ = 3
X₁ agt l₁ = 3
X₂ X₁X₁ l₂ = 3

CSE 490gz - Lecture 9 - Winter 2004

49

Transmission Example

S → tAABCa
A → BBB
B → Ct
C → ag

T = Transmitted
T tagt[0, 1, 3] 1 [0, 1, 3] 1

X₀ tX₂X₂X₁ l₀ = 4
X₁ agt l₁ = 3
X₂ X₁X₁ l₂ = 3

CSE 490gz - Lecture 9 - Winter 2004

50

Transmission Example

S → tAABCa
A → BBB
B → Ct
C → ag

T = Transmitted
T tagt[0, 1, 3] 1 [0, 1, 3] 1 [1, 0, 2]

X₀ tX₂X₂X₁X₃ l₀ = 5
X₁ X₃t l₁ = 2
X₂ X₁X₁ l₂ = 3
X₃ ag l₃ = 2

CSE 490gz - Lecture 9 - Winter 2004

51

Transmission Example

S → tAABCa
A → BBB
B → Ct
C → ag

T = Transmitted
T tagt[0, 1, 3] 1 [0, 1, 3] 1 [1, 0, 2] a

X₀ tX₂X₂X₁X₃a l₀ = 6
X₁ X₃t l₁ = 2
X₂ X₁X₁ l₂ = 3
X₃ ag l₃ = 2

CSE 490gz - Lecture 9 - Winter 2004

52

Kieffer-Yang Improvement

- Kieffer and Yang developed a theoretical framework for studying these types of grammars in 2000.

– KY is universal; it achieves entropy in the limit

- Add to sequitur Reduction Rule 5:

S → AB	S → AA	
A → CD	A → CD	
B → aE	B → aE	Adding this constraint
C → ab	C → ab	makes sequitur
D → cd	D → cd	universal.
E → bD	E → bD	

<A> = = abcd

CSE 490gz - Lecture 9 - Winter 2004

53

Compression Quality

- Neville-Manning and Witten 1997

	size	comp	gzip	sequitur	PPMC	bzip2
bib	111261	3.35	2.51	2.48	2.12	1.98
book	768771	3.46	3.35	2.82	2.52	2.42
geo	102400	6.08	5.34	4.74	5.01	4.45
obj2	246814	4.17	2.63	2.68	2.77	2.48
pic	513216	0.97	0.82	0.90	0.98	0.78
prog	38611	3.87	2.68	2.83	2.49	2.53

■ = First; ■ = Second; ■ = Third.

Files from the Calgary Corpus
Units in bits per character (8 bits)
compress - based on LZW
gzip - based on LZ77
PPMC - adaptive arithmetic coding with context
bzip2 - Burrows-Wheeler block sorting

CSE 490gz - Lecture 9 - Winter 2004

54

Notes on Sequitur

- Yields compression and hierarchical structure simultaneously.
- With clever encoding is competitive with the best of the standards.
- The grammar size is not close to approximation algorithms
 - Upper = $O((n/\log n)^{3/4})$; Lower = $\Omega(n^{1/3})$. (Lehman, 2002)
- *But!* Practical linear time encoding and decoding.

CSE 490gz - Lecture 9 - Winter 2004

55

Other Grammar Based Methods

- Longest Match
- Most frequent digram
- Match producing the best compression

CSE 490gz - Lecture 9 - Winter 2004

56
