# Lecture 3: Loss Functions and Optimization

## Administrative: Assignment 1

Due 10/20 11:59pm

- K-Nearest Neighbor
- Linear classifiers: SVM, Softmax
- Two-layer neural network
- Image features

## Administrative: Project proposal

Due Friday 10/27

Come to office hours to talk about potential ideas.

Use EdStem to find teammates

Administrative: EdStem

Please make sure to check and read all pinned EdStem posts.

## Image Classification: A core task in Computer Vision

#### **Intraclass Variation**

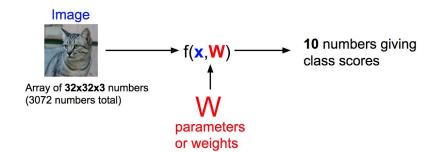

This image is CC0 1.0 public domain

## Recall from last time: data-driven approach, kNN

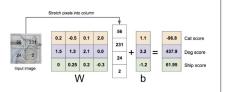

## Recall from last time: Linear Classifier

$$f(x,W) = Wx + b$$

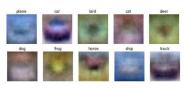

#### Algebraic Viewpoint

$$f(x,W) = Wx$$

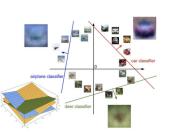

#### Visual Viewpoint

One template per class

#### Geometric Viewpoint

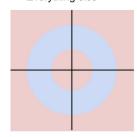

Hyperplanes cutting up space

#### Class 1:

Class 2 Everything else

1 <= L2 norm <= 2

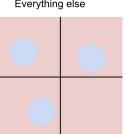

#### Class 1:

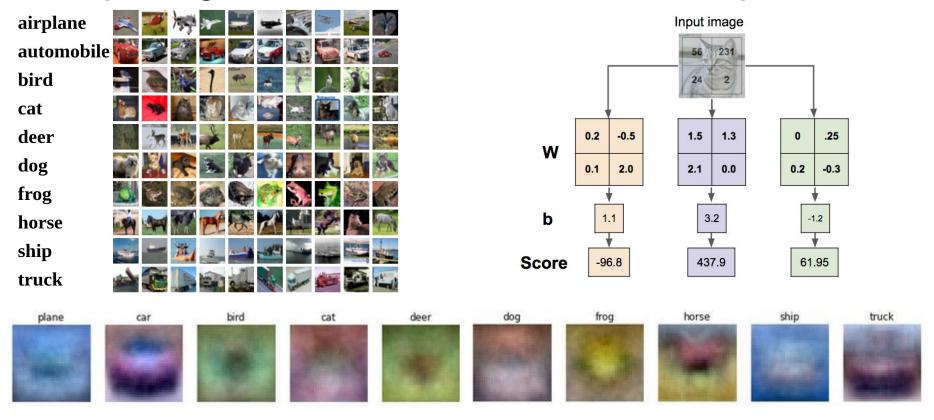

Three modes

#### Class 2

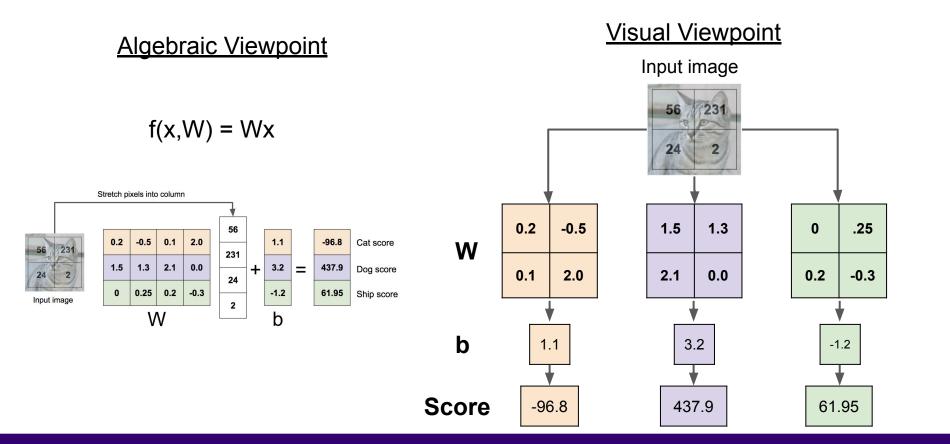

Everything else

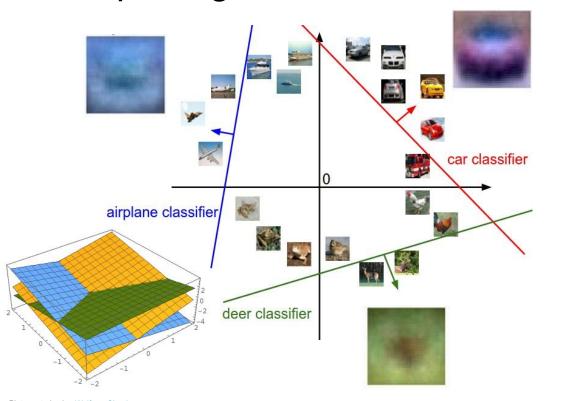

## Interpreting a Linear Classifier: Visual Viewpoint

## Example with an image with 4 pixels, and 3 classes (cat/dog/ship)

## Interpreting a Linear Classifier: Geometric Viewpoint

$$f(x,W) = Wx + b$$

Array of **32x32x3** numbers (3072 numbers total)

Cat image by Nikita is licensed under CC-BY 2.0

## Today: How to train the weights in a Linear Classifier

#### TODO:

- 1. Define a **loss function** that quantifies our unhappiness with the scores across the training data.
- 2. Come up with a way of efficiently finding the parameters that minimize the loss function. **(optimization)**

## Example output for CIFAR-10:

airplane	-3.45	-0.51	3.42
alipialie		-0.51	3.42
automobile	-8.87	6.04	4.64
bird	0.09	5.31	2.65
cat	2.9	-4.22	5.1
deer	4.48	-4.19	2.64
dog	8.02	3.58	5.55
frog	3.78	4.49	-4.34
horse	1.06	-4.37	-1.5
ship	-0.36	-2.09	-4.79
truck	-0.72	-2.93	6.14

Cat image by Nikita is licensed under CC-BY 2.0; Car image is CC0 1.0 public domain; Frog image is in the public domain

- A random W produces the following 10 scores for the 3 images to the left.
- 10 scores because there are 10 classes.
- First column bad because dog is highest.
- Second column good.
- Third column bad because frog is highest

## Q6: What if we used

$$L_i = \sum_{j 
eq y_i} \max(0, s_j - s_{y_i} + 1)^2$$

### Multiclass SVM Loss: Example code

$$L_i = \sum_{j 
eq y_i} \max(0, s_j - s_{y_i} + 1)$$

```
def L_i_vectorized(x, y, W):
  scores = W.dot(x)
                                                               # First calculate scores
  margins = np.maximum(0, scores - scores[y] + 1) # Then calculate the margins s_i - s_{vi} + 1
                                                               # only sum j is not y_i, so when j = y_i, set to zero.
  margins[y] = 0
                                                               # sum across all j
  loss i = np.sum(margins)
  return loss i
```

$$f(x, W) = Wx$$

$$L = rac{1}{N} \sum_{i=1}^{N} \sum_{j 
eq y_i} \max(0, f(x_i; W)_j - f(x_i; W)_{y_i} + 1)$$

Q7. Suppose that we found a W such that L = 0. Is this W unique?

$$f(x,W) = Wx$$
  $L = rac{1}{N} \sum_{i=1}^N \sum_{j 
eq y_i} \max(0,f(x_i;W)_j - f(x_i;W)_{y_i} + 1)$ 

E.g. Suppose that we found a W such that L = 0. Is this W unique?

No! 2W is also has L = 0!

Suppose: 3 training examples, 3 classes. With some W the scores f(x, W) = Wx are:

cat	3.2	1.3	2.2
car	5.1	4.9	2.5
frog	-1.7	2.0	-3.1

= 0

$$f(x,W) = Wx$$
  $L = rac{1}{N} \sum_{i=1}^N \sum_{j 
eq y_i} \max(0,f(x_i;W)_j - f(x_i;W)_{y_i} + 1)$ 

E.g. Suppose that we found a W such that L = 0. Is this W unique?

No! 2W is also has L = 0! How do we choose between W and 2W?

$$L(W) = \frac{1}{N} \sum_{i=1}^{N} L_i(f(x_i, W), y_i)$$

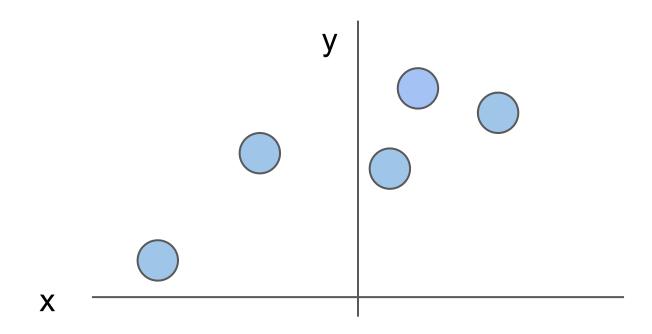

**Data loss**: Model predictions should match training data

$$L(W) = \frac{1}{N} \sum_{i=1}^{N} L_i(f(x_i, W), y_i) + \lambda R(W)$$

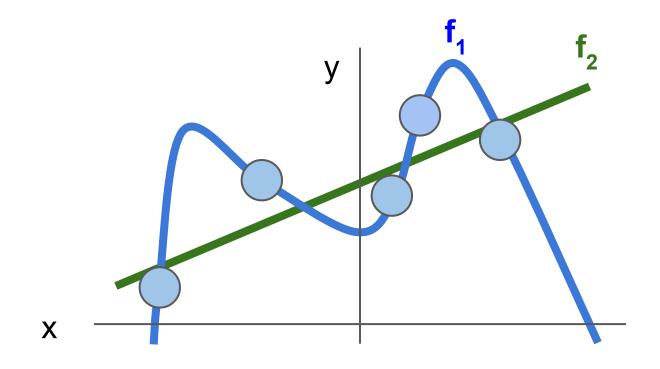

**Data loss**: Model predictions should match training data

**Regularization**: Prevent the model from doing *too* well on training data

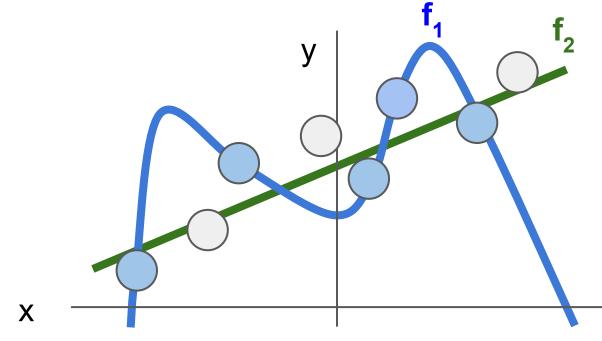

### Regularization intuition: toy example training data

### Regularization intuition: Prefer Simpler Models

### Regularization: Prefer Simpler Models

Regularization pushes against fitting the data too well so we don't fit noise in the data

$$L(W) = \frac{1}{N} \sum_{i=1}^{N} L_i(f(x_i, W), y_i) + \lambda R(W)$$

**Data loss**: Model predictions should match training data

**Regularization**: Prevent the model from doing *too* well on training data

Occam's Razar: Among multiple competing hypotheses, the simplest is the best, William of Ockham 1285-1347

$$\lambda$$
 = regularization strength (hyperparameter)

$$L(W) = \underbrace{\frac{1}{N} \sum_{i=1}^{N} L_i(f(x_i, W), y_i) + \lambda R(W)}_{i=1}$$

**Data loss**: Model predictions should match training data

**Regularization**: Prevent the model from doing *too* well on training data

$$\lambda$$
 = regularization strength (hyperparameter)

$$L(W) = \underbrace{\frac{1}{N} \sum_{i=1}^{N} L_i(f(x_i, W), y_i) + \lambda R(W)}_{i=1}$$

**Data loss**: Model predictions should match training data

**Regularization**: Prevent the model from doing *too* well on training data

#### Simple examples

L2 regularization: 
$$R(W) = \sum_{k} \sum_{l} W_{k,l}^2$$

L1 regularization: 
$$R(W) = \sum_{k} \sum_{l} |W_{k,l}|$$

Elastic net (L1 + L2): 
$$R(W) = \sum_k \sum_l \beta W_{k,l}^2 + |W_{k,l}|$$

$$\lambda$$
 = regularization strength (hyperparameter)

$$L(W) = \underbrace{\frac{1}{N} \sum_{i=1}^{N} L_i(f(x_i, W), y_i) + \lambda R(W)}_{i=1}$$

**Data loss**: Model predictions should match training data

**Regularization**: Prevent the model from doing too well on training data

#### Simple examples

L2 regularization: 
$$R(W) = \sum_{k} \sum_{l} W_{k,l}^2$$

L1 regularization:  $R(W) = \sum_{k} \sum_{l} |W_{k,l}|$ 

Elastic net (L1 + L2):  $R(W) = \sum_{k} \sum_{l} \beta W_{k,l}^{2} + |W_{k,l}|$ 

Stochastic depth, fractional pooling, etc

More complex:

Batch normalization

Dropout

$$\lambda$$
 = regularization strength (hyperparameter)

$$L(W) = \frac{1}{N} \sum_{i=1}^{N} L_i(f(x_i, W), y_i) + \lambda R(W)$$

**Data loss**: Model predictions should match training data

**Regularization**: Prevent the model from doing *too* well on training data

Why regularize?

- Express preferences over weights
- Make the model *simple* so it works on test data
- Improve optimization by adding curvature

### Regularization: Expressing Preferences

$$x = [1, 1, 1, 1] \ w_1 = [1, 0, 0, 0]$$

$$w_2 = [0.25, 0.25, 0.25, 0.25]$$

$$w_1^T x = w_2^T x = 1$$

L2 Regularization

$$R(W) = \sum_k \sum_l W_{k,l}^2$$

Which of w1 or w2 will the L2 regularizer prefer?

### Regularization: Expressing Preferences

$$x = egin{array}{c} [1,1,1,1] \ w_1 = egin{array}{c} [1,0,0,0] \end{array}$$

$$w_2 = \left[0.25, 0.25, 0.25, 0.25\right]$$

$$w_1^T x = w_2^T x = 1$$

L2 Regularization

$$R(W) = \sum_{k} \sum_{l} W_{k,l}^2$$

Which of w1 or w2 will the L2 regularizer prefer?

L2 regularization likes to "spread out" the weights

### Regularization: Expressing Preferences

$$x = egin{aligned} [1,1,1,1] \ w_1 = egin{aligned} [1,0,0,0] \end{aligned}$$

$$w_2 = \left[0.25, 0.25, 0.25, 0.25\right]$$

$$w_1^T x = w_2^T x = 1$$

L2 Regularization

$$R(W) = \sum_{k} \sum_{l} W_{k,l}^2$$

Which of w1 or w2 will the L2 regularizer prefer?

L2 regularization likes to "spread out" the weights

Which one would L1 regularization prefer?

Want to interpret raw classifier scores as probabilities

$$s=f(x_i;W)$$

 $P(Y=k|X=x_i) = rac{e^{s_k}}{\sum_j e^{s_j}}$  Softmax Function

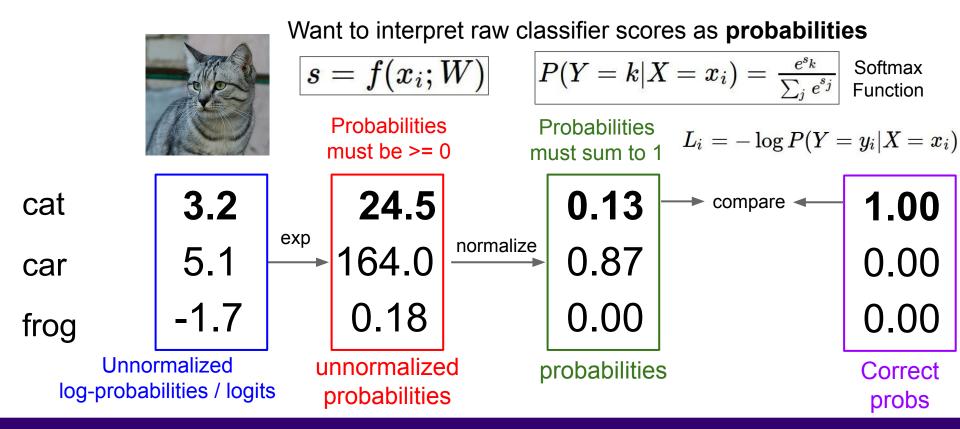

Probabilities must be >= 0

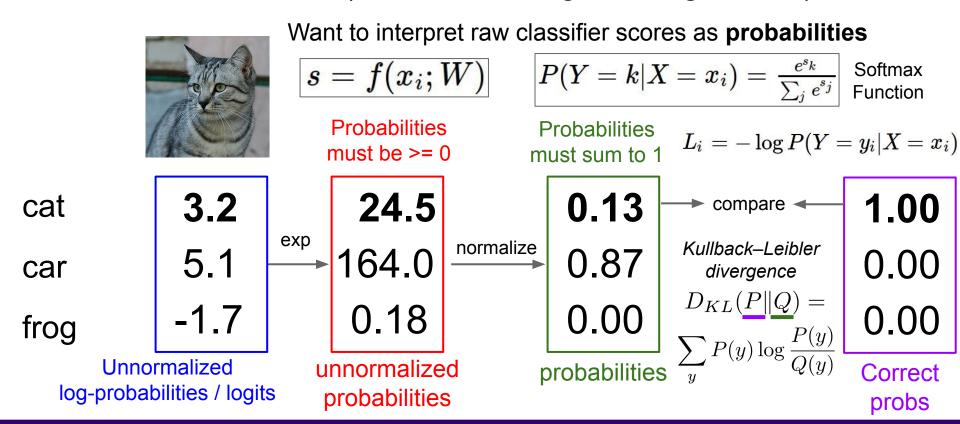

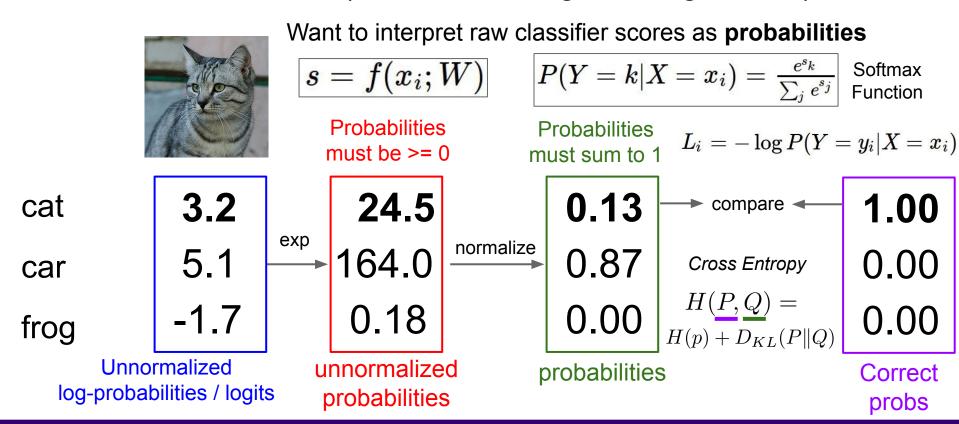

Want to interpret raw classifier scores as **probabilities** 

$$s=f(x_i;W)$$

$$oxed{s=f(x_i;W)} oxed{P(Y=k|X=x_i)=rac{e^{s_k}}{\sum_j e^{s_j}}}$$
 Softmax Function

Maximize probability of correct class

Putting it all together:

$$L_i = -\log P(Y = y_i | X = x_i)$$

$$L_i = -\log(rac{e^{sy_i}}{\sum_j e^{s_j}})$$

Want to interpret raw classifier scores as **probabilities** 

$$s=f(x_i;W)$$

$$oxed{s=f(x_i;W)} oxed{P(Y=k|X=x_i)=rac{e^{s_k}}{\sum_j e^{s_j}}}$$
 Softmax Function

Maximize probability of correct class

Putting it all together:

$$L_i = -\log P(Y = y_i | X = x_i)$$

$$L_i = -\log(rac{e^{sy_i}}{\sum_j e^{s_j}})$$

$$L_i = -\log(rac{e^{sy_i}}{\sum_j e^{s_j}})$$

3.2 cat

5.1 car

-1.7 frog

Q2: At initialization all s will be approximately equal; what is the loss? A:  $-\log(1/C) = \log(C)$ ,

If C = 10, then  $L_i = log(10) \approx 2.3$ 

### Softmax vs. SVM

$$L_i = -\log(rac{e^{sy_i}}{\sum_i e^{s_j}})$$

$$L_i = \sum_{j 
eq y_i} \max(0, s_j - s_{y_i} + 1)$$

Softmax vs. SVM

$$L_i = -\log(rac{e^{sy_i}}{\sum_i e^{s_j}})$$

$$L_i = \sum_{j 
eq y_i} \max(0, s_j - s_{y_i} + 1)$$

assume scores: 
$$[10, -2, 3]$$
  $[10, 9, 9]$   $[10, -100, -100]$  and  $y_i = 0$ 

Q: What is the **softmax loss** and the **SVM** loss?

Softmax vs. SVM

$$L_i = -\log(rac{e^{sy_i}}{\sum_i e^{s_j}})$$

$$L_i = \sum_{j 
eq y_i} \max(0, s_j - s_{y_i} + 1)$$

assume scores: [20, -2, 3][20, 9, 9] [20, -100, -100]

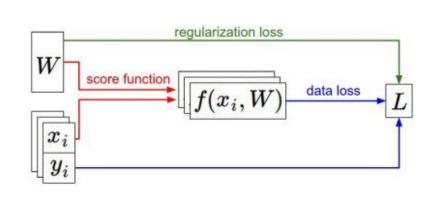

Q: What is the **softmax loss** and the SVM loss if I double the correct class score from 10 -> 20?

and  $y_i = 0$ 

## Recap

- We have some dataset of (x,y)
- We have a **score function**:  $s=f(x;W)\stackrel{\text{e.g.}}{=}Wx$
- We have a **loss function**:

$$L_i = -\log(rac{e^{sy_i}}{\sum_j e^{s_j}})$$
 SVM $L_i = \sum_{j 
eq y_i} \max(0, s_j - s_{y_i} + 1)$  $L = rac{1}{N} \sum_{i=1}^N L_i + R(W)$  Full loss

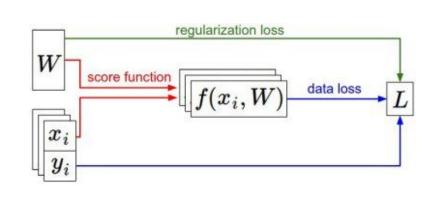

## Recap

### How do we find the best W?

- We have some dataset of (x,y)
- We have a **score function**:  $s = f(x; W) \stackrel{\text{e.g.}}{=} Wx$
- We have a **loss function**:

$$L_i = -\log(rac{e^{sy_i}}{\sum_j e^{s_j}})$$
 SVM $L_i = \sum_{j 
eq y_i} \max(0, s_j - s_{y_i} + 1)$  $L = rac{1}{N} \sum_{i=1}^N L_i + R(W)$  Full loss

# Optimization

 $\underline{\text{This image}} \text{ is } \underline{\text{CC0 1.0}} \text{ public domain}$ 

 $\underline{\text{Walking man image}} \text{ is } \underline{\text{CC0 1.0}} \text{ public domain}$ 

### Strategy #1: A first very bad idea solution: Random search

```
# assume X train is the data where each column is an example (e.g. 3073 x 50,000)
# assume Y train are the labels (e.g. 1D array of 50,000)
# assume the function L evaluates the loss function
bestloss = float("inf") # Python assigns the highest possible float value
for num in xrange(1000):
 W = np.random.randn(10, 3073) * 0.0001 # generate random parameters
 loss = L(X train, Y train, W) # get the loss over the entire training set
 if loss < bestloss: # keep track of the best solution
   bestloss = loss
   bestW = W
 print 'in attempt %d the loss was %f, best %f' % (num, loss, bestloss)
# prints:
# in attempt 0 the loss was 9.401632, best 9.401632
# in attempt 1 the loss was 8.959668, best 8.959668
# in attempt 2 the loss was 9.044034, best 8.959668
# in attempt 3 the loss was 9.278948, best 8.959668
# in attempt 4 the loss was 8.857370, best 8.857370
# in attempt 5 the loss was 8.943151, best 8.857370
# in attempt 6 the loss was 8.605604, best 8.605604
# ... (trunctated: continues for 1000 lines)
```

### Lets see how well this works on the test set...

```
# Assume X_test is [3073 x 10000], Y_test [10000 x 1]
scores = Wbest.dot(Xte_cols) # 10 x 10000, the class scores for all test examples
# find the index with max score in each column (the predicted class)
Yte_predict = np.argmax(scores, axis = 0)
# and calculate accuracy (fraction of predictions that are correct)
np.mean(Yte_predict == Yte)
# returns 0.1555
```

15.5% accuracy! not bad! (SOTA is ~99.7%)

### Strategy #2: Follow the slope

### Strategy #2: Follow the slope

In 1-dimension, the derivative of a function:

$$rac{df(x)}{dx} = \lim_{h o 0} rac{f(x+h) - f(x)}{h}$$

In multiple dimensions, the **gradient** is the vector of (partial derivatives) along each dimension

The slope in any direction is the **dot product** of the direction with the gradient The direction of steepest descent is the **negative gradient**

# This is silly. The loss is just a function of W:

$$egin{aligned} L &= rac{1}{N} \sum_{i=1}^{N} L_i + \sum_k W_k^2 \ L_i &= \sum_{j 
eq y_i} \max(0, s_j - s_{y_i} + 1) \ s &= f(x; W) = Wx \end{aligned}$$

want  $\nabla_W L$ 

# This is silly. The loss is just a function of W:

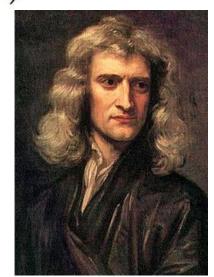

$$L = \frac{1}{N} \sum_{i=1}^{N} L_i + \sum_k W_k^2$$

$$L_i = \sum_{j 
eq y_i} \max(0, s_j - s_{y_i} + 1)$$

$$s = f(x; W) = Wx$$

want  $\nabla_W L$ 

Use calculus to compute an analytic gradient

This image is in the public domain

#### [0.34,[-2.5, dW = ...-1.11, 0.6, (some function 0.78, 0, data and W) 0.12, 0.2, 0.55, 0.7, 2.81, -0.5, -3.1, 1.1, -1.5, 1.3, [0.33,...]-2.1,....] loss 1.25347 Lecture 3 - 93 Ali Farhadi, Aditya Kusupati October 5, 2023

gradient dW:

### In summary:

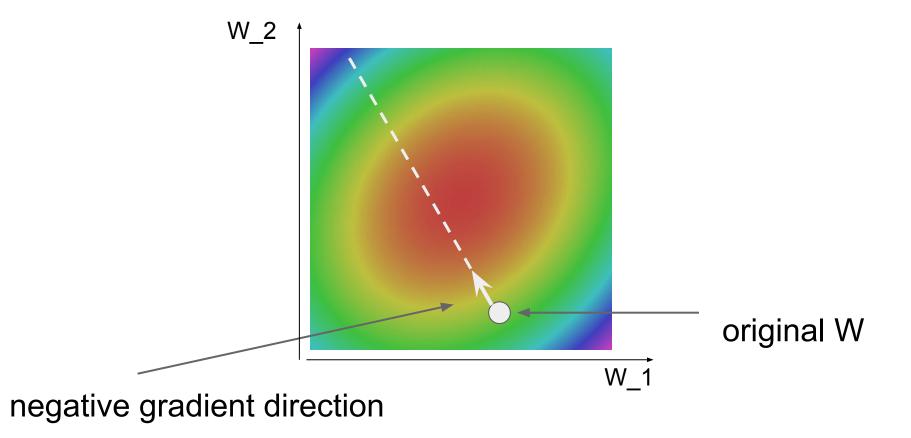

- Numerical gradient: approximate, slow, easy to write
- Analytic gradient: exact, fast, error-prone

=>

<u>In practice:</u> Always use analytic gradient, but check implementation with numerical gradient. This is called a **gradient check.** 

### Gradient Descent

```
# Vanilla Gradient Descent
while True:
 weights grad = evaluate gradient(loss fun, data, weights)
  weights += - step size * weights grad # perform parameter update
```

### Stochastic Gradient Descent (SGD)

$$L(W) = \frac{1}{N} \sum_{i=1}^{N} L_i(x_i, y_i, W) + \lambda R(W)$$

$$\nabla_W L(W) = \frac{1}{N} \sum_{i=1}^{N} \nabla_W L_i(x_i, y_i, W) + \lambda \nabla_W R(W)$$

Full sum expensive when N is large!

Approximate sum using a **minibatch** of examples 32 / 64 / 128 common

```
# Vanilla Minibatch Gradient Descent

while True:
   data_batch = sample_training_data(data, 256) # sample 256 examples
   weights_grad = evaluate_gradient(loss_fun, data_batch, weights)
   weights += - step size * weights grad # perform parameter update
```
