503 Software Engineering Research

• Not: how to write good software
  – and get a good job at Amazon/Google/Microsoft
• Research methods and ideas in SE
  – this may make you a more thoughtful developer
What does my program do?

Program analysis techniques:

- **Abstract interpretation** (dataflow, symbolic exec.)
- **Type systems** (checking, inference, non-standard types)
- **Model checking** (explicit vs. symbolic, abstraction)
- **Analysis back-ends** & decision procedures (BDDs, SAT, SMT)
- **Testing** (generation, selection, prioritization)
- **Dynamic analysis** (profiling)
- **Refactoring**
- **Slicing**
- **Verification**
- **More**
Abstract interpretation
(or “dataflow analysis”)

• Statically (over-)estimate what the program may do at run time
• “Run” your program statically
  – Choose an abstract domain; e.g., \{ +, 0, - \}
  – Assign semantics to operators
  – Start at beginning of program
  – Examine possible values of variables
• Similar to unfolding the computation
• Used daily on aeronautics software
Type systems

• A type is a set of (possible) values
• Checking
• Inference
• Polymorphism
• Non-standard type systems
  – view type system as a set of constraints to compute legal refactoring
  – use type inference to recover abstractions from optimized code
Model checking

• In simplest terms, exhaustive testing
  – Verify that every possible execution satisfies a given property
  – Very effective for hardware (inherently finite-state)
  – Popular for concurrent software

• How to make this scale?
  – Choose abstractions that lose just the right amount of precision
    • Counterexample-guided refinement
  – Efficient encodings
Analysis back-ends

• Reduce one problem to another
  – Often, produce a logical formula

• Reduction to SAT
  – 1979: “Problem X reduces to SAT, so it is hard.”
  – 2009: “Problem X reduces to SAT, so it is easy.”

• SMT (satisfiability modulo theories)
  – add non-logical constructs (e.g., arithmetic) to the logical formula

• Datalog (prolog-like; used in database community)

• Binary Decision Diagrams (BDDs)

• Boolean programs

• Theorem provers
Test generation

• Random
  – Scaleable, and more effective than you think

• Symbolic
  – What `if` statements guard a line of code?
  – Compute an input that satisfies them

• Concolic (**concrete + symbolic**)
  – Run tests, then try to slightly modify them to achieve more coverage

• Evaluation of testing approaches
  – Coverage, mutation, ...
Dynamic analysis

• Testing
• Model creation
  – Observe executions, generalize from them
• Type inference
• Fault localization
Refactoring

- Refactoring changes program code without changing its meaning
- What constraints need to be generated to preserve the meaning?
- How to explore the space of solutions?
More

• Pointer and alias analysis
• Modeling and model-based development
• Configuration management
• Code generation and code completion
• Historical analysis
  – Prediction of bug-prone code
Applications

• Security
• Correctness
• Performance
• Rapid development
• System analysis
• Maintenance and evolution
Broader themes

• Precision vs. performance
• Power vs. transparency
• Static vs. dynamic
• Tuning analysis to the real problem
A limited perspective on SE

• Too many ideas in software engineering for 10 weeks

• People, process, development methodology

• Mining source code repositories (see CSE 504, winter 2016)

• User studies (see CSE 599E1, autumn 2016)

• ... much more
Format

• Lectures:
  – 50%: classic background
  – 50%: current research
  – Lectures are interactive (and, few slides)

• Homework:
  – Read research papers
  – 1 in-class presentation

• Group project to put the ideas into practice
  – Makes you a better researcher, in any field
  – You choose a topic (suggestions are provided)
  – Most projects lead to a publication or other research use
    • Not a requirement, just a common outcome
Who cares?

• Intellectually exciting and deep
• Spans both “hard” and “soft” areas of computing
• Connections to programming languages, security, systems, architecture, databases, and many more!
• Quals credit
