Computer-Aided Reasoning for Software

# Program Synthesis

#### **Emina Torlak**

emina@cs.washington.edu

## **Today**

#### **Last lecture**

Solvers as angelic runtime oracle

#### **Today**

• Program synthesis: from specs to code

#### **Reminders**

- HW3 is due on Friday.
- No class next week; happy Thanksgiving!

## The program synthesis problem

 $\exists P. \forall x. \phi(x, P(x))$ 

Find a program P that satisfies the specification  $\phi$  on all inputs.

## The program synthesis problem

φ may be a formula, a reference implementation, input / output pairs, traces, demonstrations, etc.

 $\exists P. \forall x. \phi(x, P(x))$ 

Find a program P that satisfies the specification  $\phi$  on all inputs.

## The program synthesis problem

φ may be a formula, a reference implementation, input / output pairs, traces, demonstrations, etc.

#### Synthesis improves

- Productivity (when writing φ is easier than writing P).
- Correctness (when verifying φ is easier than verifying P).

 $\exists P. \forall x. \phi(x, P(x))$ 

Find a program P that satisfies the specification φ on all inputs.

 $\exists P. \forall x. \phi(x, P(x))$ 

Synthesis as a problem in deductive theorem proving.

Synthesis as a search problem.

 $\exists P. \forall x. \phi(x, P(x))$ 

Deductive (classic) synthesis

Inductive (syntax-guided) synthesis

 $\exists P. \forall x. \phi(x, P(x))$ 

#### Deductive (classic) synthesis

Derive the program P from the constructive proof of the theorem  $\forall x. \exists y. \varphi(y, x)$ .

Inductive (syntax-guided) synthesis

 $\exists P. \forall x. \phi(x, P(x))$ 

#### Deductive (classic) synthesis

Derive the program P from the constructive proof of the theorem  $\forall x. \exists y. \varphi(y, x)$ .

# Inductive (syntax-guided) synthesis

Discover the program P by searching a restricted space of candidate programs for one that satisfies  $\phi$  on all inputs.

 $\exists P. \forall x. \phi(x, P(x))$ 

#### **SPIRAL**

#### Deductive (classic) synthesis

Derive the program P from the constructive proof of the theorem  $\forall x. \exists y. \varphi(y, x)$ .

#### **FlashFill**

# Inductive (syntax-guided) synthesis

Discover the program P by searching a restricted space of candidate programs for one that satisfies φ on all inputs.

Denali Superoptimizer [Joshi, Nelson, Randall, PLDI'02]

Specification  $\phi$ , given as a reference implementation.

Denali Superoptimizer [Joshi, Nelson, Randall, PLDI'02]

Specification φ, given as a reference implementation.

reg6 \* 4 + 1

Denali Superoptimizer [Joshi, Nelson, Randall, PLDI'02]

Optimal (lowest cost) program P that is equivalent to φ on all inputs (values of reg6).

Specification  $\phi$ , given as a reference implementation.

reg6 \* 4 + 1

Denali Superoptimizer [Joshi, Nelson, Randall, PLDI'02]

Optimal (lowest cost) program P that is equivalent to φ on all inputs (values of reg6).

s4addl(reg6, 1)

$$\forall$$
 k, n.  $2^n = 2^{**}n$ 

$$\forall k, n. k^{*}2^{n} = k << n$$

$$\forall$$
 k, n. k\*4 + n = s4addl(k, n)

. . .

#### Two kinds of axioms:

- Instruction semantics.
- Algebraic properties of functions and relations used for specifying instruction semantics.

Specification φ, given as a reference implementation.

- I. Construct an E-graph.
- 2. Use a SAT solver to search the E-graph for a K-cycle program.

Optimal (lowest cost) program P that is equivalent to  $\phi$  on all inputs (values of reg6).

reg6 \* 4 + 1

Denali Superoptimizer [Joshi, Nelson, Randall, PLDI'02]

s4addl(reg6, 1)

$$\forall$$
 k, n.  $2^n = 2^{**}n$ 

$$\forall$$
 k, n. k\*2<sup>n</sup> = k << n

$$\forall$$
 k, n. k\*4 + n = s4addl(k, n)

. . .

#### Two kinds of axioms:

- Instruction semantics.
- Algebraic properties of functions and relations used for specifying instruction semantics.

$$reg6 * 4 + 1$$

$$\forall$$
 k, n.  $2^n = 2^{**}n$ 

$$\forall k, n. k^{*}2^{n} = k << n$$

$$\forall$$
 k, n. k\*4 + n = s4addl(k, n)

. . .

E-graph matching

SAT

$$reg6 * 4 + 1$$

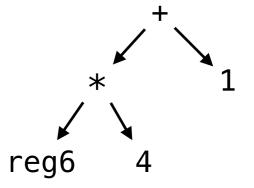

$$\forall k, n. 2^n = 2^{**}n$$

$$\forall$$
 k, n.  $k*2^n = k << n$ 

$$\forall$$
 k, n. k\*4 + n = s4addl(k, n)

. . .

E-graph matching

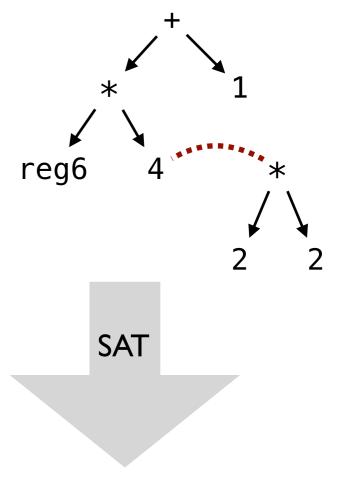

SAT

$$reg6 * 4 + 1$$

$$\forall$$
 k, n.  $2^n = 2^{**}n$ 
 $\forall$  k, n.  $k^*2^n = k << n$ 
 $\forall$  k, n.  $k^*4 + n = s4addl(k, n)$ 

\_ \_ \_

E-graph matching

$$reg6 * 4 + 1$$

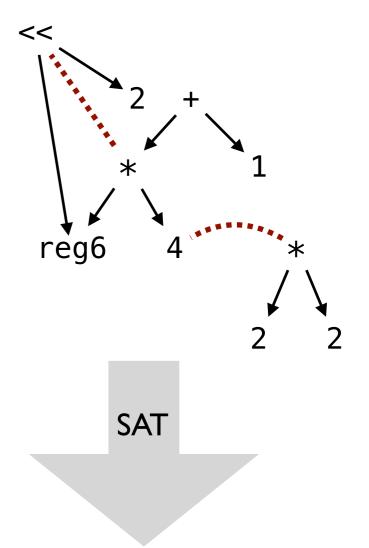

$$\forall$$
 k, n.  $2^n = 2^{**}n$ 

$$\forall$$
 k, n. k\*2<sup>n</sup> = k << n

$$\forall$$
 k, n. k\*4 + n = s4addl(k, n)

. . .

E-graph matching

$$reg6 * 4 + 1$$

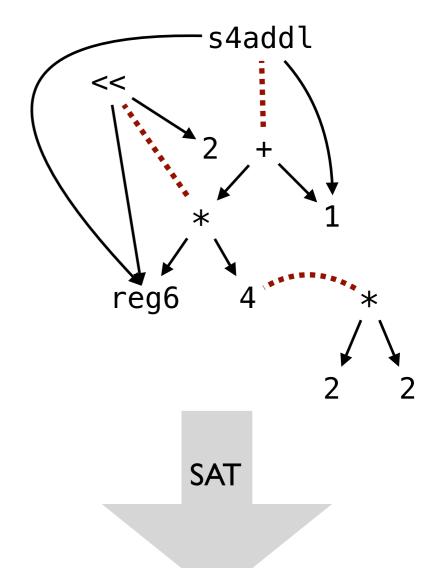

$$\forall$$
 k, n.  $2^n = 2^{**}n$ 

$$\forall$$
 k, n.  $k*2^n = k << n$ 

$$\forall$$
 k, n. k\*4 + n = s4addl(k, n)

. . .

E-graph matching

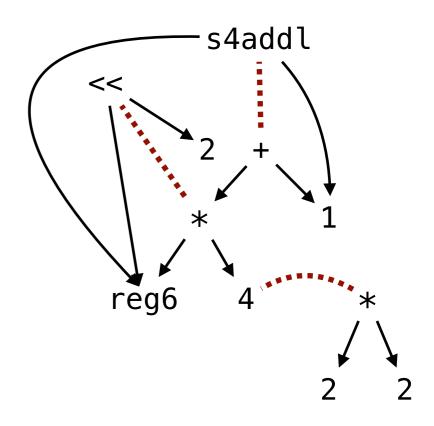

## Deductive synthesis versus compilation

#### **Deductive synthesizer**

- Non-deterministic.
- Searches all correct rewrites for one that is optimal.

#### Compiler

- Deterministic.
- Lowers a source program into a target program using a fixed sequence of rewrite steps.

### Deductive synthesis versus inductive synthesis

 $\exists P. \forall x. \phi(x, P(x))$ 

#### **Deductive synthesis**

- Efficient and provably correct: thanks to the semantics-preserving rules, only correct programs are explored.
- Requires sufficient axiomatization of the domain.
- Requires *complete* specifications to seed the derivation.

### Deductive synthesis versus inductive synthesis

 $\exists P. \forall x. \phi(x, P(x))$ 

#### **Deductive synthesis**

- Efficient and provably correct: thanks to the semantics-preserving rules, only correct programs are explored.
- Requires sufficient axiomatization of the domain.
- Requires *complete* specifications to seed the derivation.

#### **Inductive synthesis**

- Works with *multi-modal and partial* specifications.
- Requires no axioms.
- But often at the cost of lower efficiency and weaker (bounded) guarantees on the correctness/ optimality of synthesized code.

**CEGIS:** 

Counterexample-Guided Inductive Synthesis

[Solar-Lezama et al, ASPLOS'06]

A partial or multimodal specification φ of the desired program (e.g., assertions, i/o pairs).

reg6 \* 4 + 1

**CEGIS:** 

Counterexample-Guided Inductive Synthesis [Solar-Lezama et al,

ASPLOS'06]

A partial or multimodal specification φ of the desired program (e.g., assertions, i/o pairs).

$$reg6 * 4 + 1$$

Counterexample-Guided Inductive Synthesis [Solar-Lezama et al, ASPLOS'06]

```
expr :=
  const | reg6 |
  s4addl(expr, expr) |
...
```

A syntactic sketch (e.g., a grammar) describing the shape of the desired program P.

This defines the space of candidate programs to search. Can be fine-tuned for better performance.

A partial or multimodal specification φ of the desired program (e.g., assertions, i/o pairs).

reg6 \* 4 + 1

Counterexample-Guided Inductive Synthesis [Solar-Lezama et al, ASPLOS'06]

A program P from the given space of candidates that satisfies φ on all (usually bounded) inputs.

s4addl(reg6, 1)

```
expr :=
  const | reg6 |
  s4addl(expr, expr) |
...
```

A syntactic sketch (e.g., a grammar) describing the shape of the desired program P.

This defines the space of candidate programs to search. Can be fine-tuned for better performance.

A partial or multimodal specification φ of the desired program (e.g., assertions, i/o pairs).

Guess a program that works on a finite set of inputs, verify it, and learn from bad guesses.

A program P from the given space of candidates that satisfies φ on all (usually bounded) inputs.

#### **CEGIS:**

Counterexample-Guided Inductive Synthesis
[Solar-Lezama et al,
ASPLOS'06]

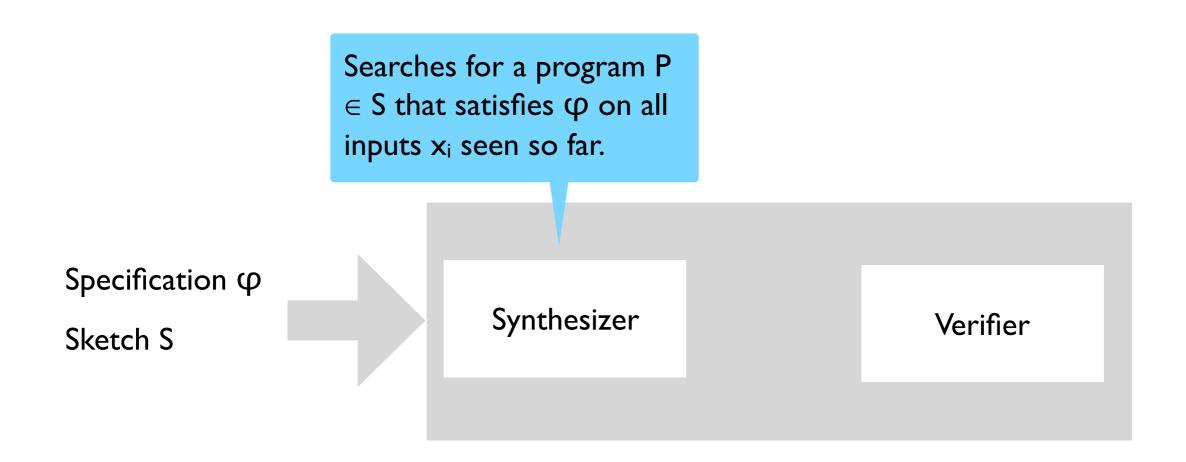

s4addl(reg6, 1)

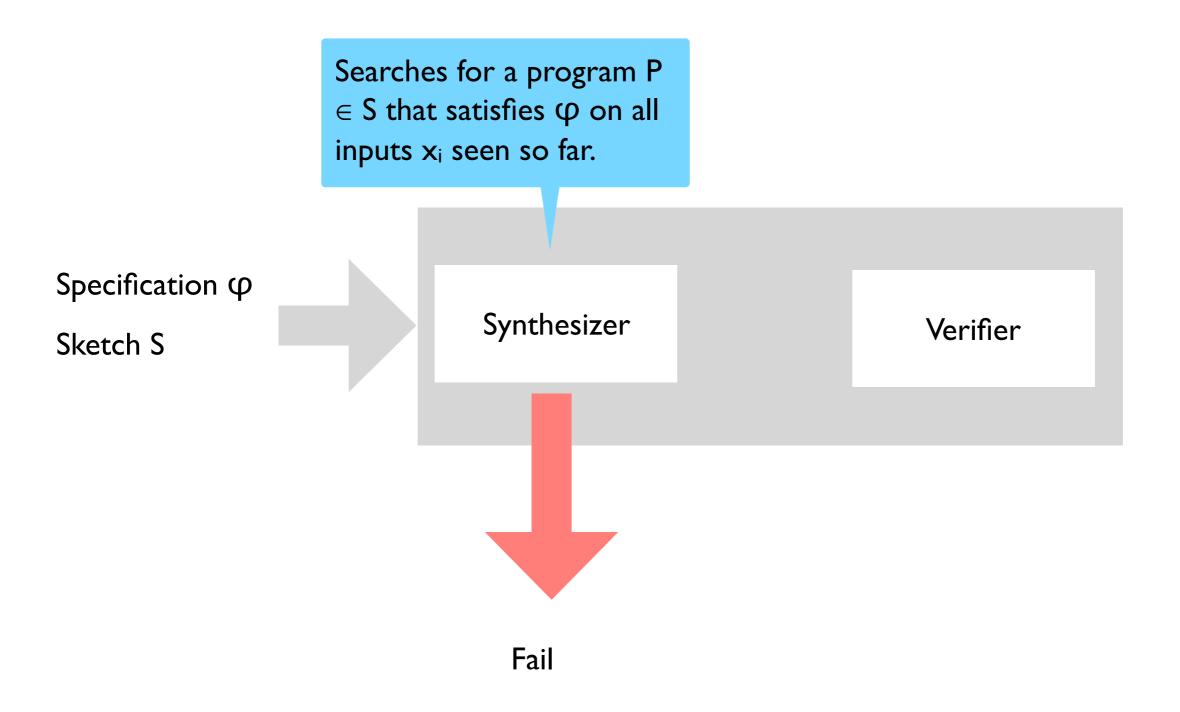

```
expr :=
  const | reg6 |
  s4addl(expr, expr) |
...
```

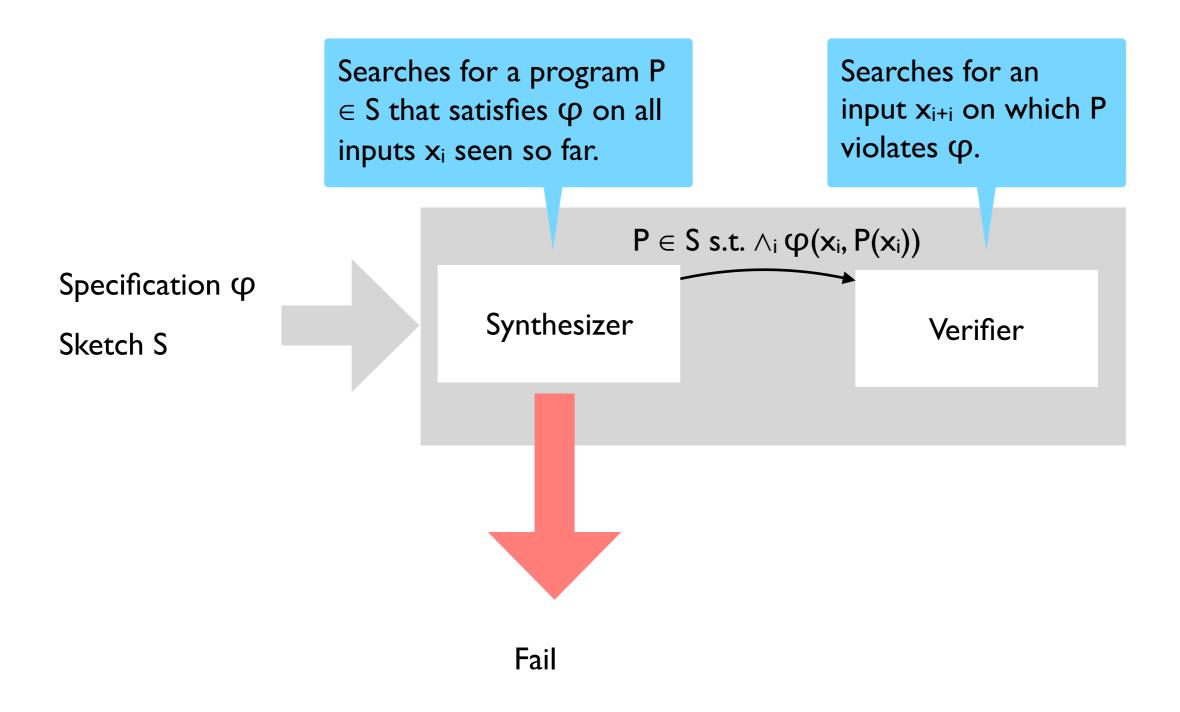

A syntactic sketch (e.g., a grammar) describing the shape of the desired program P.

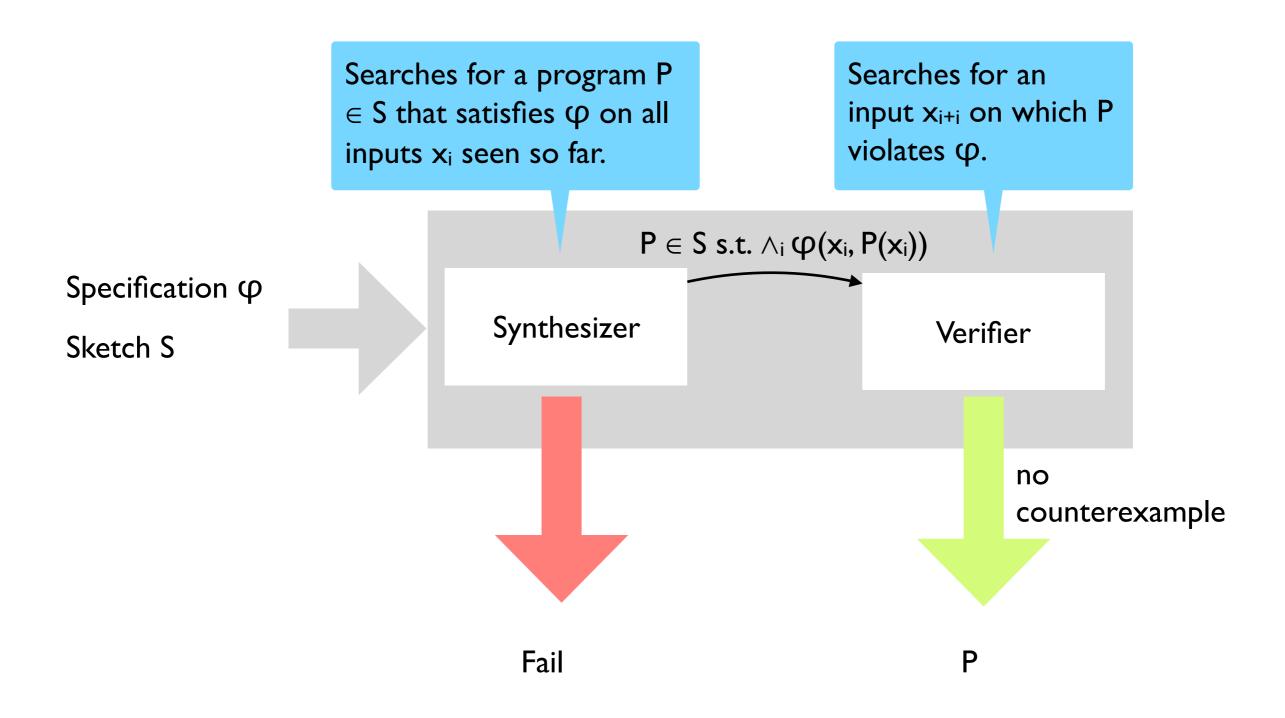

This defines the space of candidate programs to search. Can be finetuned for better performance.

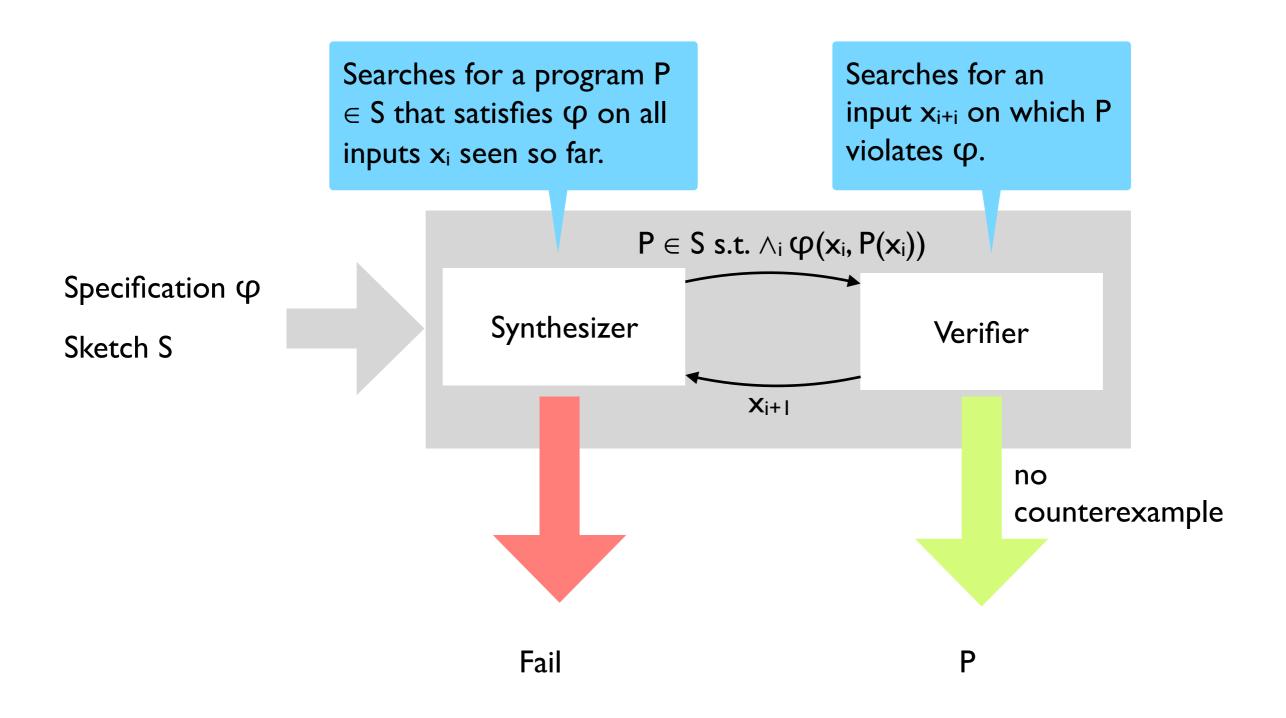

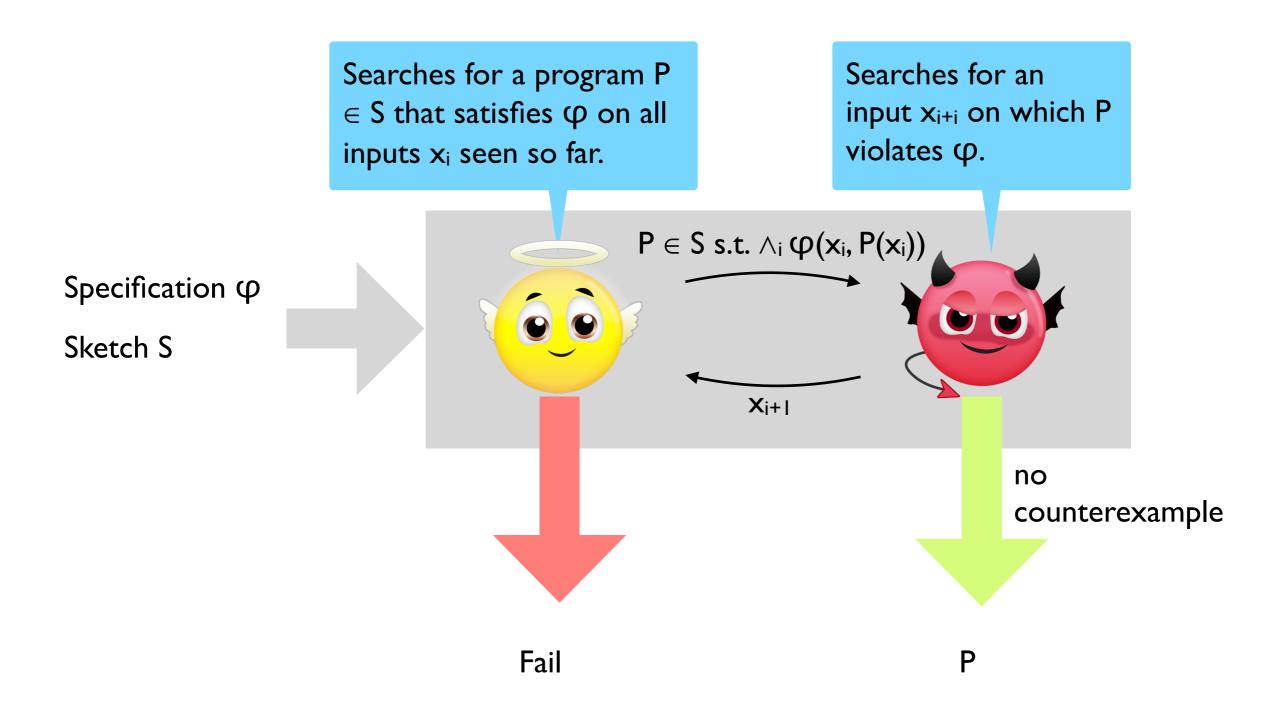

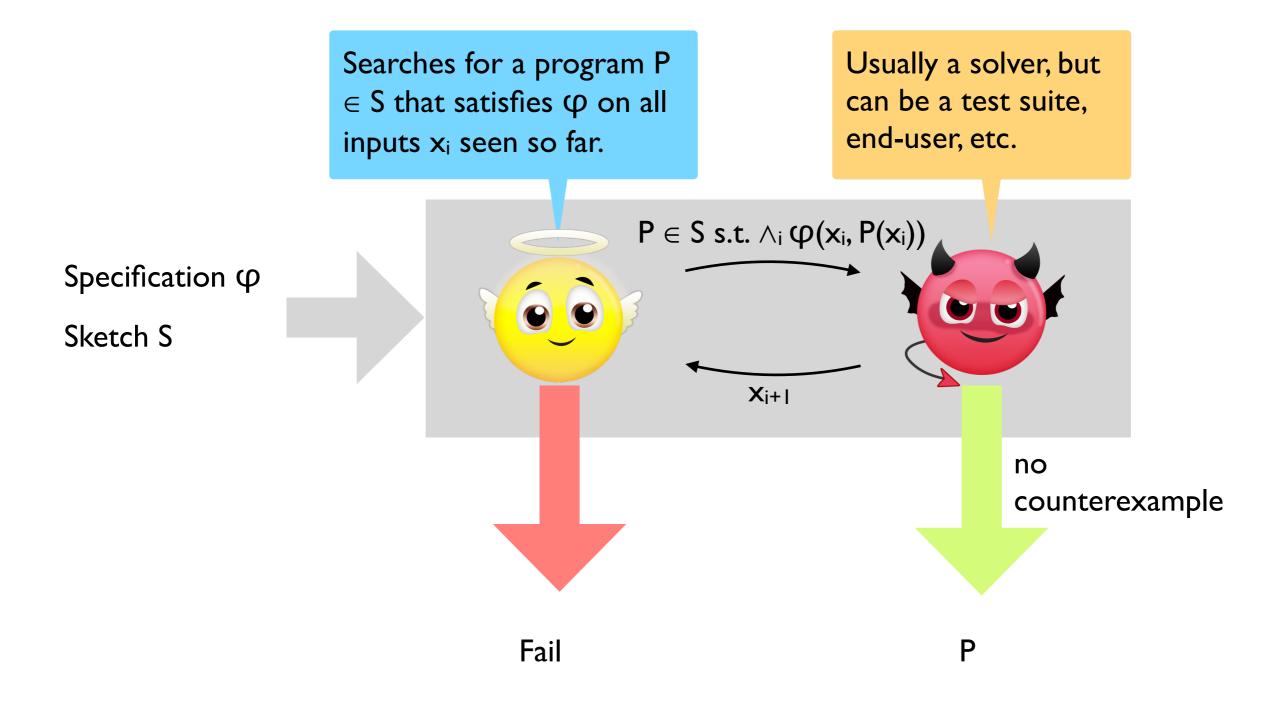

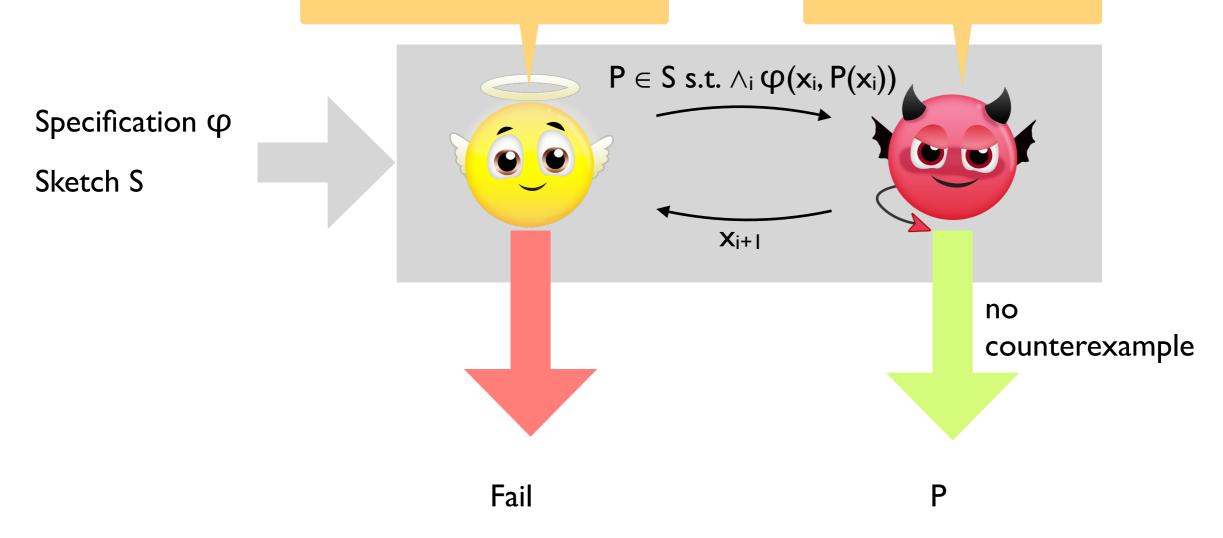

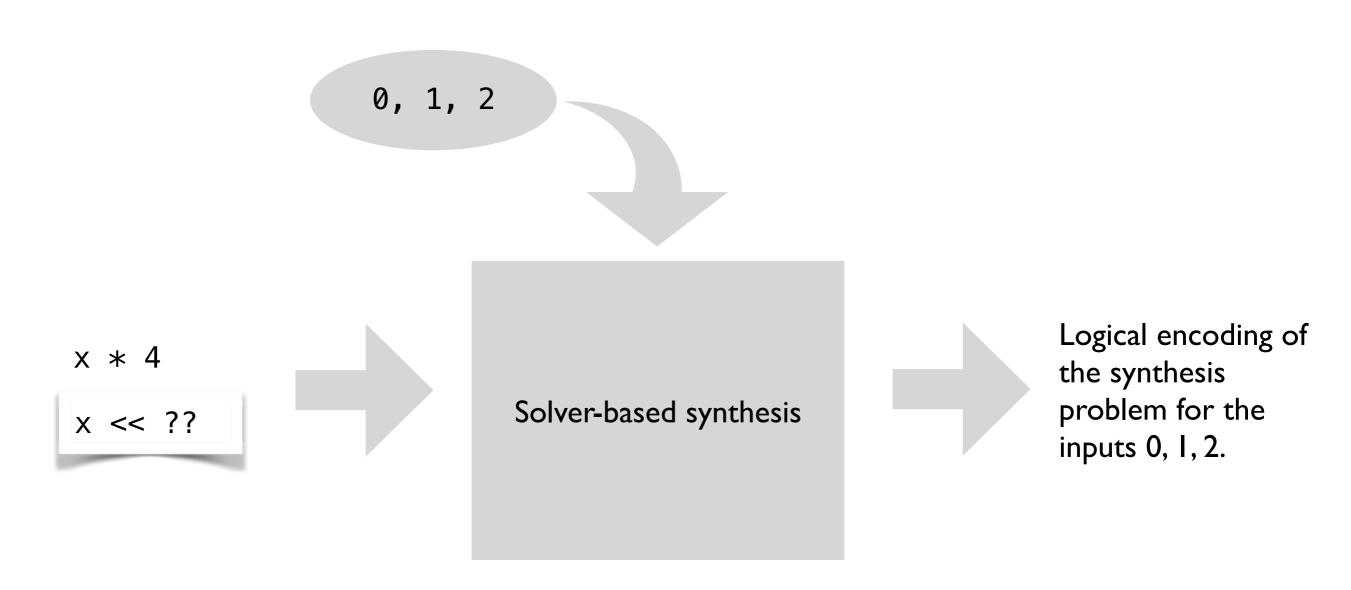

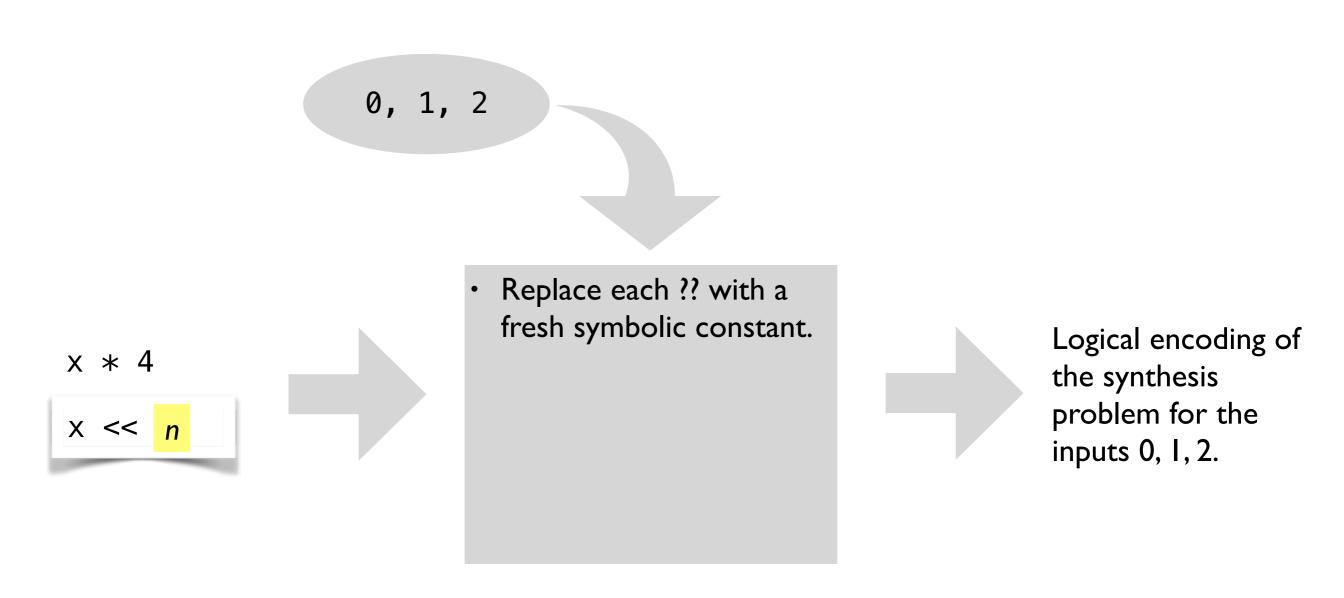

#### **Overview of CEGIS**

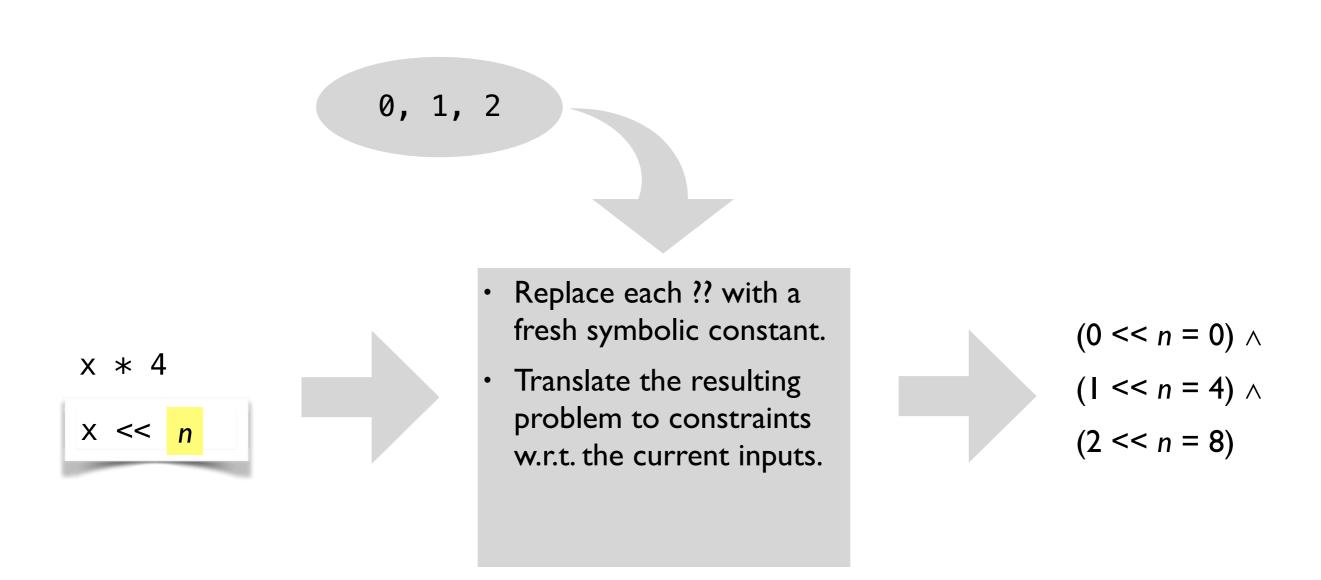

Any search algorithm: e.g., a solver, enumerative search, stochastic search.

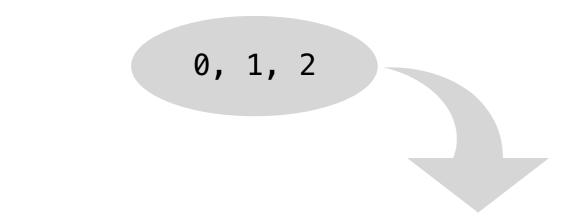

Usually a solver, but can be a test suite, end-user, etc.

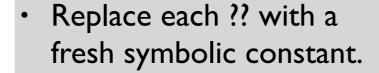

$$x * 4$$

$$x \ll n$$

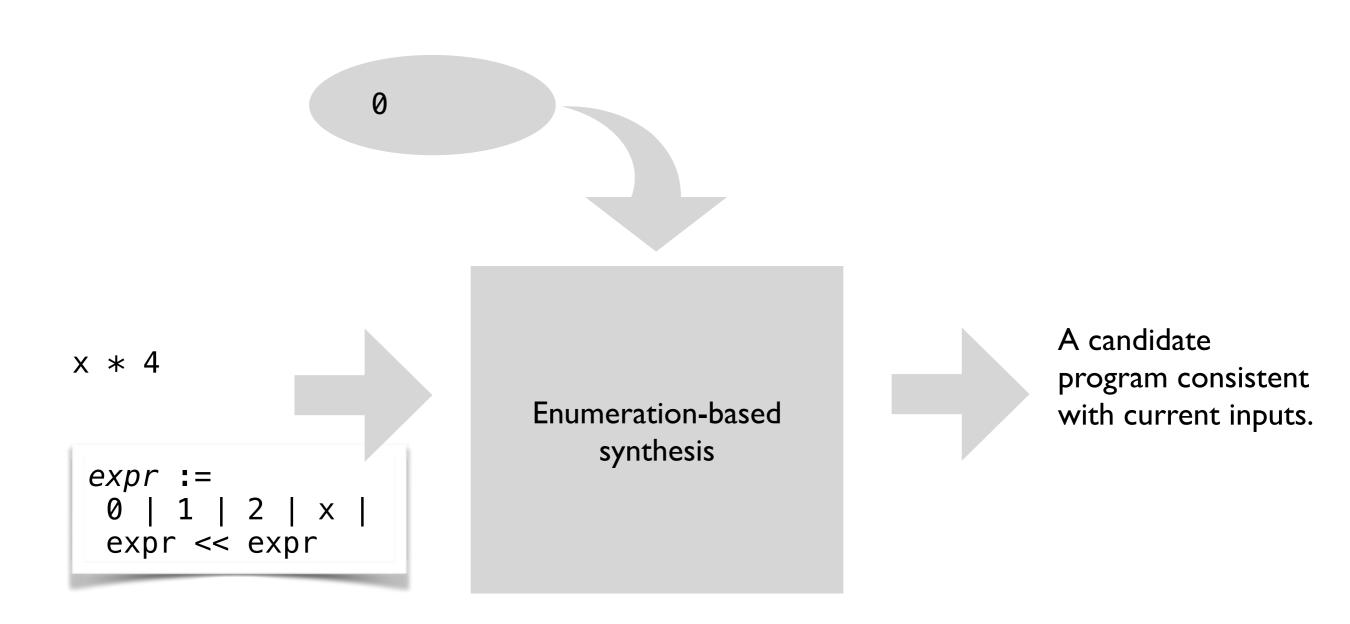

- Translate the resulting problem to constraints w.r.t. the current inputs.
- If SAT, convert the model to a program P.

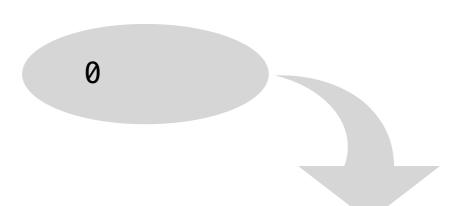

$$(0 << n = 0) \land$$

$$(1 \ll n = 4) \land$$

$$(2 << n = 8)$$

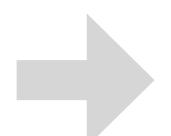

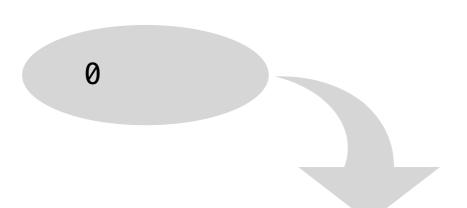

- Iteratively construct all programs of size K until one is consistent with the current inputs.
- If two programs produce the same output on all current inputs, keep just one of the two.

[Udupa et al, PLDI'13]

A candidate program consistent with current inputs.

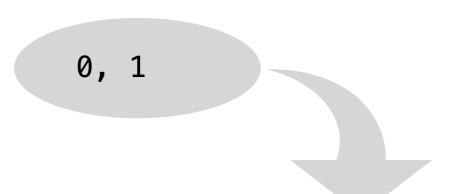

- Iteratively construct all programs of size K until one is consistent with the current inputs.
- If two programs produce the same output on all current inputs, keep just one of the two.

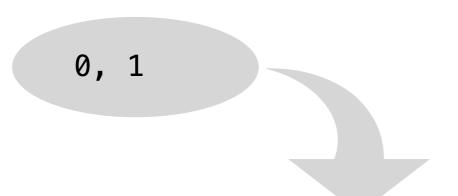

- Iteratively construct all programs of size K until one is consistent with the current inputs.
- If two programs produce the same output on all current inputs, keep just one of the two.

- Iteratively construct all programs of size *K* until one is consistent with the current inputs.
- If two programs produce the same output on all current inputs, keep just one of the two.

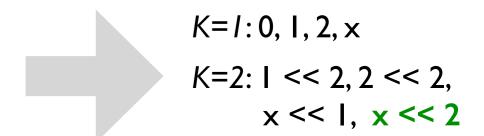

- Iteratively construct all programs of size K until one is consistent with the current inputs.
- If two programs produce the same output on all current inputs, keep just one of the two.

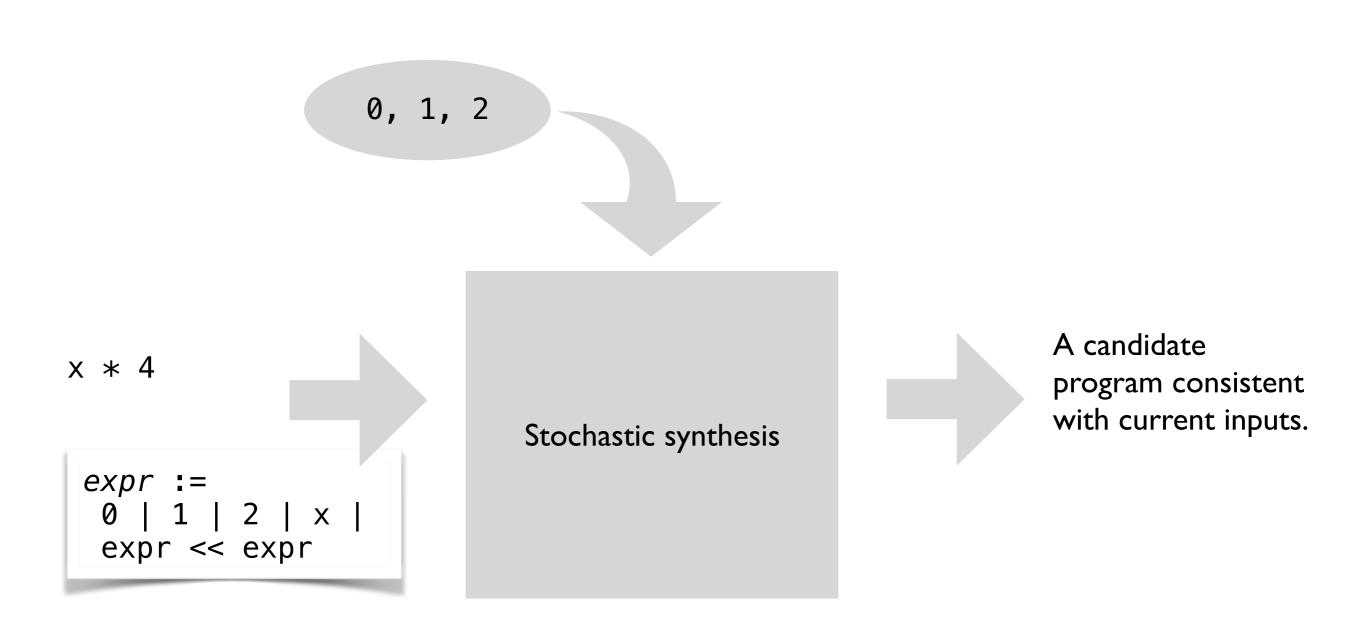

0, 1

- Iteratively construct all programs of size *K* until one is consistent with the current inputs.
- If two programs produce the same output on all current inputs, keep just one of the two.

# Synthesizing programs with stochastic search

[Schkufza et al, ASPLOS'13]

## Synthesizing programs with stochastic search

- Use Metropolis-Hastings to sample expressions.
- Mutate the current candidate program and keep the mutation with probability proportional to its correctness w.r.t. the current inputs.

A candidate program consistent with current inputs.

[Schkufza et al, ASPLOS'13]

## Summary

#### **Today**

- Deductive and inductive synthesis
- Syntax-guided synthesis with symbolic, enumerative, and stochastic search

#### **Next**

Applications of program synthesis and verification
