Hierarchical Average Link

5

Model-Based (If You Want)

6

Overview

- Motivation
- ➡ • Model-based clustering
- Validation
- Summary and Conclusions

7

Model-based clustering

- Gaussian mixture model:
 - Assume each cluster is generated by a multivariate normal distribution
 - Cluster k has parameters :
 - Mean vector: μ_k
 - Covariance matrix: Σ_k

8

Model-based clustering

- Gaussian mixture model:
 - Assume each cluster is generated by a multivariate normal distribution
 - Cluster k has parameters :
 - Mean vector: μ_k
 - Covariance matrix: Σ_k

9

Variance & Covariance

- Variance $\text{var}(x) = E((x - \bar{x})^2) = \sigma_x^2$
- Covariance $\text{cov}(x, y) = E((x - \bar{x})(y - \bar{y}))$
- Correlation $\text{cor}(x, y) = \frac{\text{cov}(x, y)}{\sigma_x \sigma_y}$

10

Gaussian Distributions

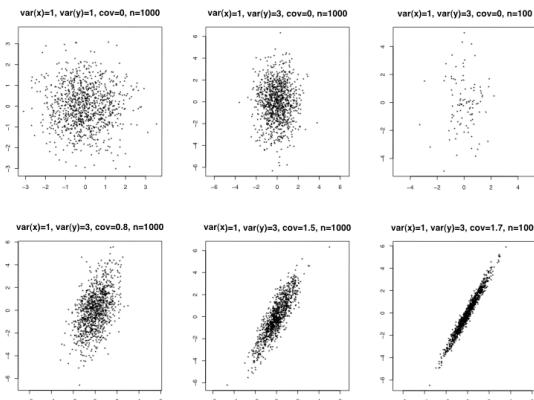

- Univariate $\frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{1}{2}(x-\bar{x})^2/\sigma^2}$
- Multivariate $\frac{1}{\sqrt{(2\pi)^n |\Sigma|}} e^{-\frac{1}{2}(x-\bar{x})^T (\Sigma^{-1})(x-\bar{x})}$

where Σ is the variance/covariance matrix:

$$\Sigma_{i,j} = E((x_i - \bar{x}_i)(x_j - \bar{x}_j))$$

11

Variance/Covariance

12

Covariance models

(Banfield & Raftery 1993)

- Equal volume spherical model (EI): ~ kmeans

$$\Sigma_k = \lambda I$$

$$\Sigma_k = \lambda_k D_k A_k D_k^T$$

volume shape orientation

13

Covariance models

(Banfield & Raftery 1993)

- Equal volume spherical model (EI): ~ kmeans

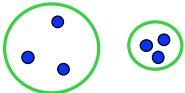

$$\Sigma_k = \lambda I$$

- Unequal volume spherical (VI):

$$\Sigma_k = \lambda_k I$$

$$\Sigma_k = \lambda_k D_k A_k D_k^T$$

volume shape orientation

14

Covariance models

(Banfield & Raftery 1993)

- Equal volume spherical model (EI): ~ kmeans

$$\Sigma_k = \lambda I$$

- Unequal volume spherical (VI):

$$\Sigma_k = \lambda_k I$$

- Diagonal model:

$$\Sigma_k = \lambda_k B_k, \text{ where } B_k \text{ is diagonal, } |B_k|=1$$

- EEE elliptical model:

$$\Sigma_k = \lambda D A D^T$$

- Unconstrained model (VVV):

$$\Sigma_k = \lambda_k D_k A_k D_k^T$$

More flexible
But more parameters

$$\Sigma_k = \lambda_k D_k A_k D_k^T$$

volume shape orientation

EM algorithm

- General approach to maximum likelihood

- Iterate between E and M steps:

- E step: compute the probability of each observation belonging to each cluster using the current parameter estimates

- M-step: estimate model parameters using the current group membership probabilities

16

Advantages of model-based clustering

- Higher quality clusters
- Flexible models
- Model selection – **A principled way to choose right model and right # of clusters**
 - Bayesian Information Criterion (**BIC**):
 - Approximate Bayes factor: posterior odds for one model against another model
 - Roughly: data likelihood, penalized for number of parameters
 - A large BIC score indicates strong evidence for the corresponding model.

17

Definition of the BIC score

$$2 \log p(D | M_k) \approx 2 \log p(D | \hat{\theta}_k, M_k) - v_k \log(n) = BIC_k$$

- The integrated likelihood $p(D|M_k)$ is hard to evaluate,
where D is the data, M_k is the model.
- BIC is an approximation to $\log p(D|M_k)$
- v_k : number of parameters to be estimated in model M_k

18

Overview

- Motivation
- Model-based clustering
- Validation
 - Methodology
 - Data Sets
 - Results
- Summary and Conclusions

19

Validation Methodology

- Compare on data sets with *external criteria* (BIC scores do **not** require the external criteria)
- To compare clusters with external criterion:
 - [Adjusted Rand index](#) (Hubert and Arabie 1985)
 - Adjusted Rand index = 1 → perfect agreement
 - 2 random partitions have an expected index of 0
- Compare quality of clusters to those from:
 - a leading heuristic-based algorithm: CAST (Ben-Dor & Yakhini 1999)
 - k-Means (EI).

20

Gene expression data sets

- Ovarian cancer data set
(Michel Schummer, Institute of Systems Biology)
 - Subset of data: 235 clones
 - 24 experiments (cancer/normal tissue samples)
 - 235 clones correspond to 4 genes
- Yeast cell cycle data (Cho et al 1998)
 - 17 time points
 - Subset of 384 genes associated with 5 phases of cell cycle

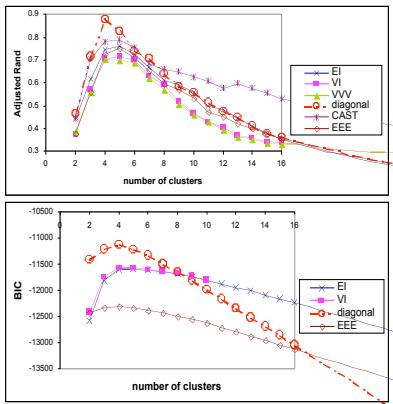

21

Synthetic data sets

Both based on ovary data

- Randomly resampled ovary data
 - For each class, randomly sample the expression levels in each experiment, independently
 - Near diagonal covariance matrix
- Gaussian mixture
 - Generate multivariate normal distributions with the sample covariance matrix and mean vector of each class in the ovary data

22

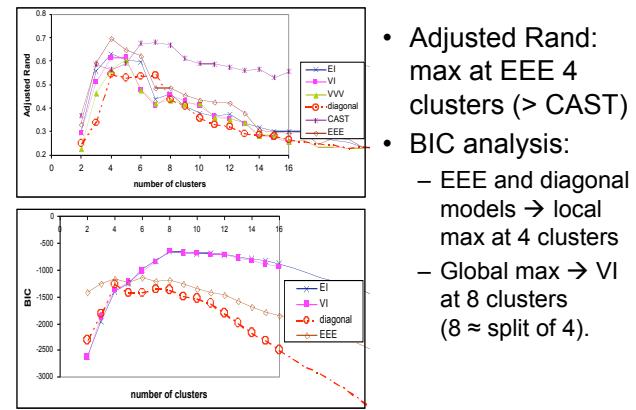

Results: randomly resampled ovary data

- Diagonal model achieves max BIC score (~expected)
- max BIC at 4 clusters (~expected)
- max adjusted Rand
- beats CAST

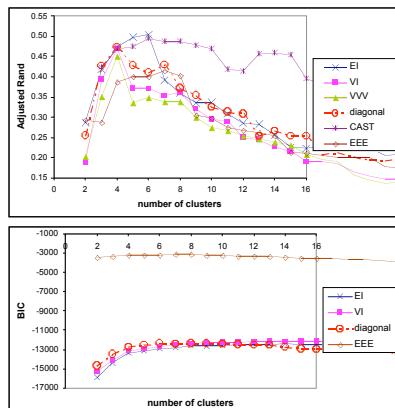

23

Results: square root ovary data

24

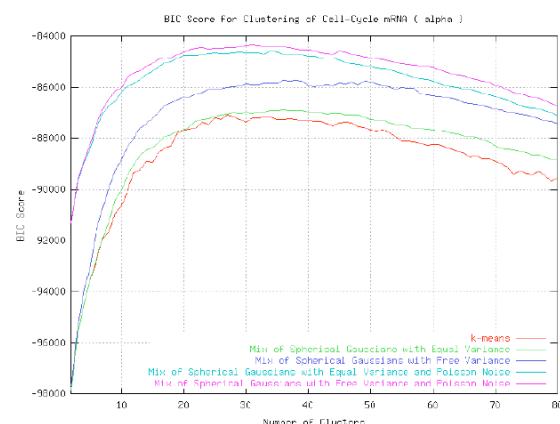

Results: standardized yeast cell cycle data

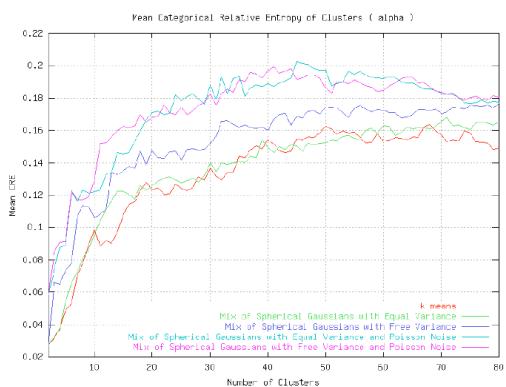

- Adjusted Rand: EI slightly > CAST at 5 clusters.
- BIC: selects EEE at 5 clusters.

25

BIC Scores for Clustering of Alpha-Factor Data with Noise Mixture Models

CRE Scores for Clustering of Alpha-Factor Data with Noise Mixture Models

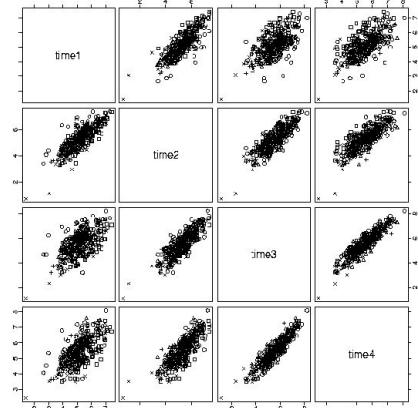

27

Overview

- Motivation
- Model-based clustering
- Validation
- Importance of Data Transformation
- Summary and Conclusions

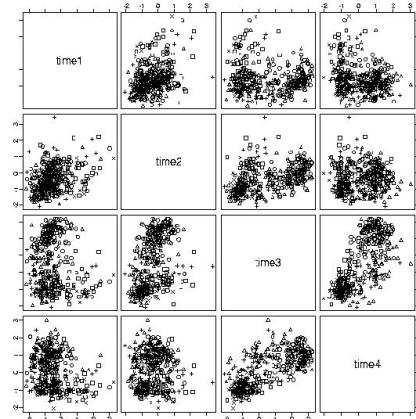

28

log yeast cell cycle data

29

Standardized yeast cell cycle data

30

Overview

- Motivation
- Model-based clustering
- Validation
- Summary and Conclusions

31

Summary and Conclusions

- Synthetic data sets:
 - With the correct model, model-based clustering better than a leading heuristic clustering algorithm
 - BIC selects the right model & right number of clusters
- Real expression data sets:
 - Comparable adjusted Rand indices to CAST
 - BIC gives a good hint as to the number of clusters
- Appropriate data transformations increase normality & cluster quality (See paper & web.)

Adjusted Rand Example

	c#1(4)	c#2(5)	c#3(7)	c#4(4)
class#1(2)	2	0	0	0
class#2(3)	0	0	0	3
class#3(5)	1	4	0	0
class#4(10)	1	1	7	1

$$a = \binom{2}{2} + \binom{3}{2} + \binom{4}{2} + \binom{7}{2} = 31$$

$$b = \binom{4}{2} + \binom{5}{2} + \binom{7}{2} + \binom{4}{2} - a = 43 - 31 = 12$$

$$c = \binom{2}{2} + \binom{3}{2} + \binom{5}{2} + \binom{10}{2} - a = 59 - 31 = 28$$

$$d = \binom{20}{2} - a - b - c = 119$$

$$Rand, R = \frac{a + d}{a + d + c + d} = 0.789$$

$$\text{Adjusted Rand} = \frac{R - E(R)}{1 - E(R)} = 0.469$$
