

CSE 544

Principles of Database Management Systems

Magdalena Balazinska

Fall 2007

Lecture 18 - Stream Processing

Final Reports & Presentations

- **Final reports**
 - Details for content and presentation are on the class website
- **Presentations**
 - Next Wednesday 9:30am-3pm, divided into three sessions
 - Please attend at least one entire session
 - Grading guidelines are on the class website
 - Schedule is posted on the class website
 - Please email Nodira to get added to the schedule

References

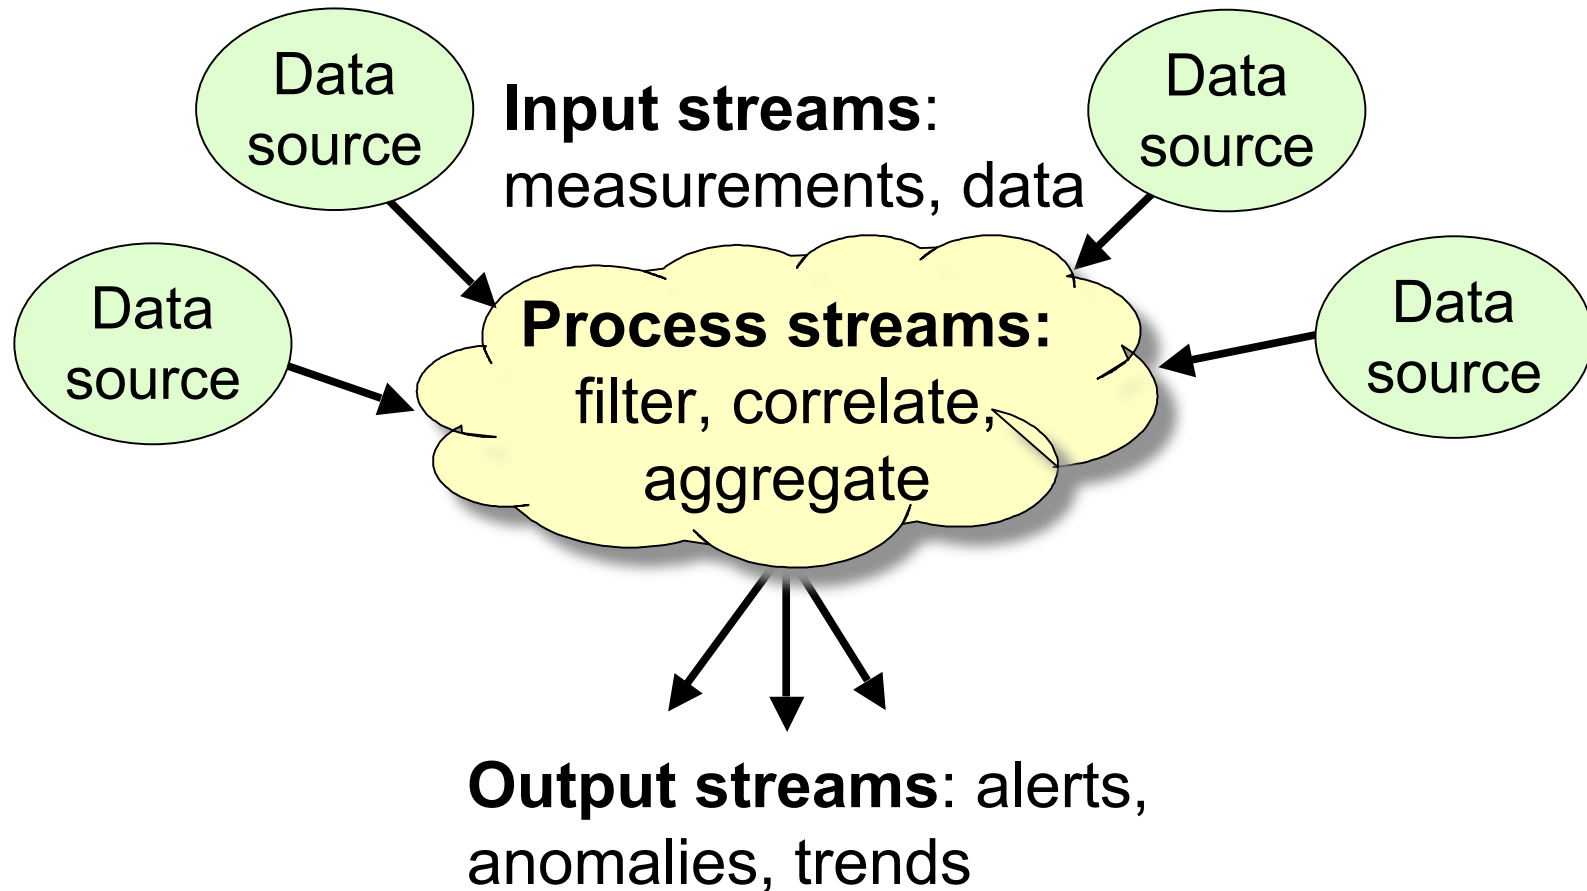

- **Aurora: A New Model and Architecture for Data Stream Management.**

Daniel Abadi et. al. VLDB Journal. 12(2). 2003

Outline

- **Stream processing applications**
 - Examples
 - Requirements
- **The Aurora stream processing engine**
 - Stream model and query model
 - Processing model
 - Operators
 - Query examples
 - Other features

Stream Processing

Application Domains

- Network monitoring
 - Intrusion, fraud, anomaly detection, click streams
- Financial services
 - Market feed processing, ticker failure detection
- Sensor-based environment monitoring
 - Weather conditions, air quality, car traffic
- Medical applications
 - Patient monitoring, equipment tracking
- Civil engineering, military applications, etc.

Requirements

- **Input data is pushed continuously**
 - Traditional DBMSs not designed for continuous loading or inserting of individual data items
 - “DBMS-active, human passive” model
- **Users want to execute continuous queries**
 - Traditional DBMSs have no direct support for such queries. Can use triggers, but triggers do not scale
- **Low-latency processing**
 - Need to see results in near real-time
 - Data is possibly high-volume and high-rate

Other Requirements

- Distribution,
- Load management and load shedding
- Approximate processing, approximate answers
- Fault-tolerance and revision processing
- Exploiting data archives

Outline

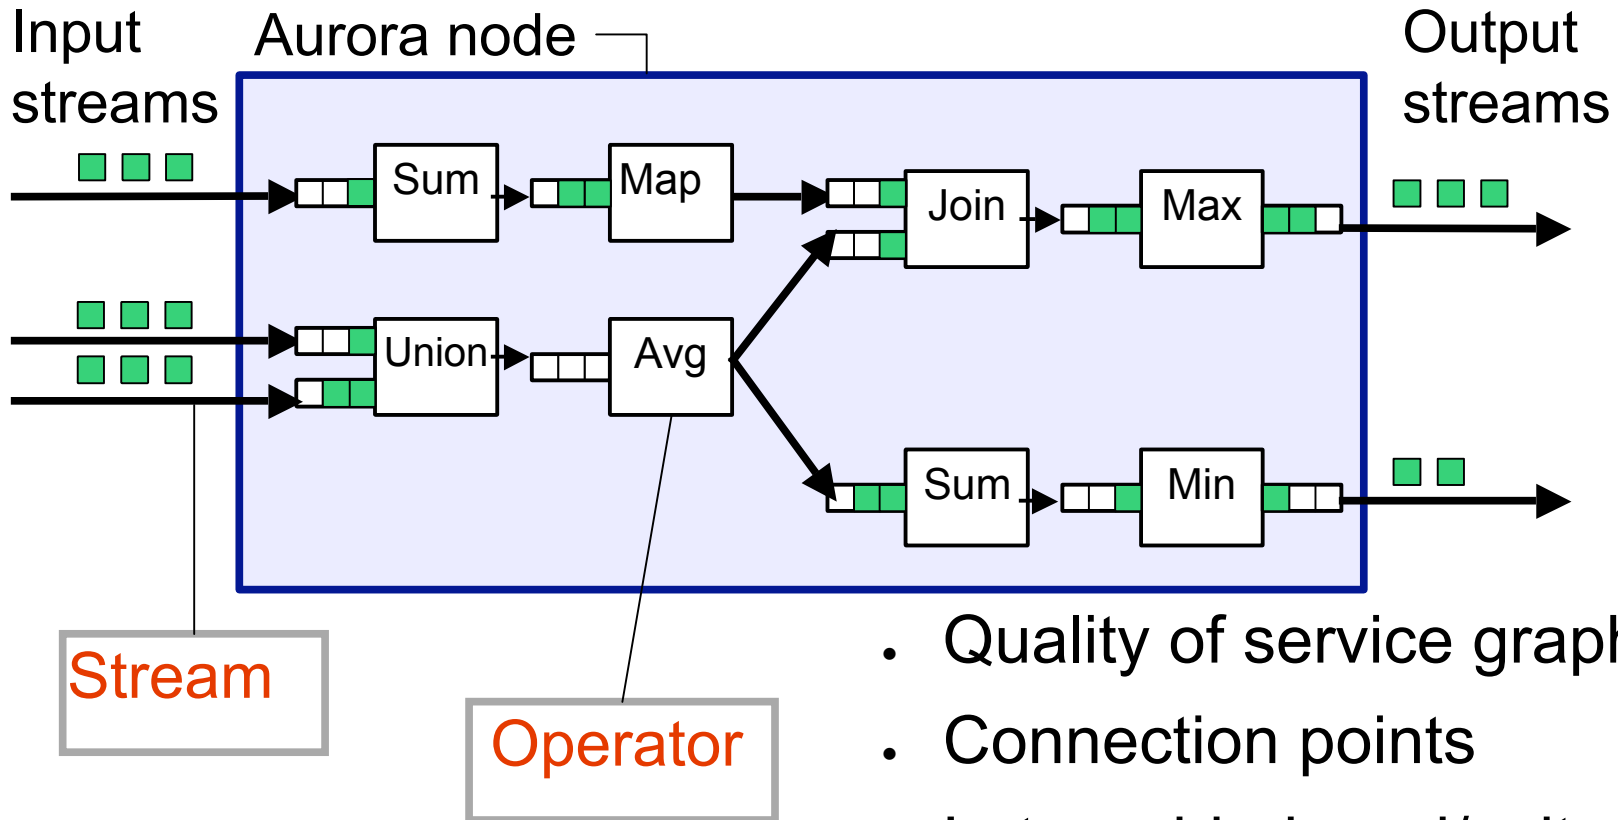

- **Stream processing applications**
 - Examples
 - Requirements
- **The Aurora stream processing engine**
 - Stream model and query model
 - Processing model
 - Operators
 - Query examples
 - Other features

Stream Data Model

Tuple: $(\overbrace{\text{timestamp}}^{\text{header}}, \overbrace{v_1, \dots, v_n}^{\text{data}})$

- **Stream:** append-only sequence of tuples
- All tuples on a stream have same **schema**
- Timestamp is used for QoS

Query Model

- Quality of service graphs
- Connection points
- Later added read/write ops
- No query language

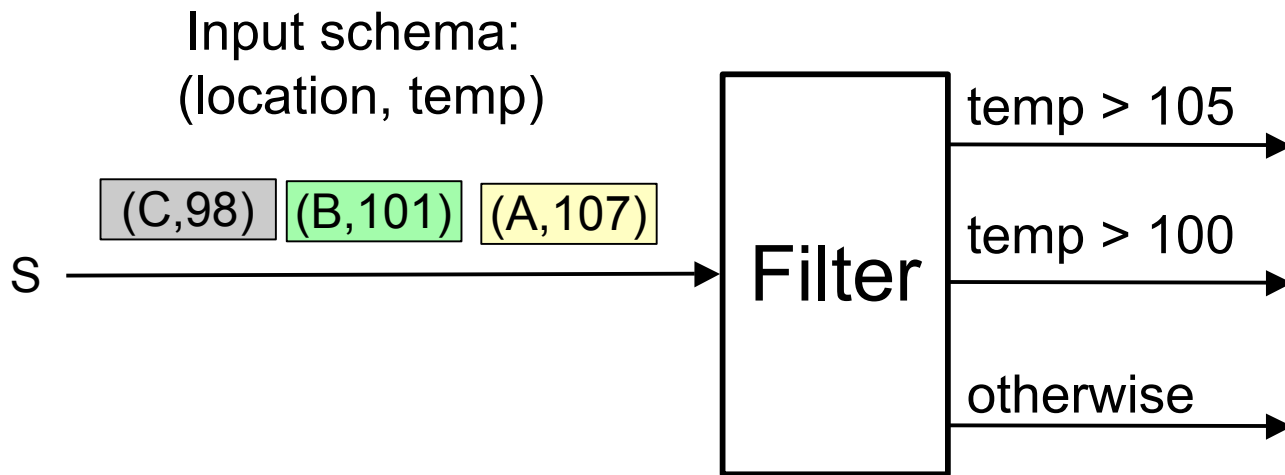

Aurora Operators

- Order-agnostic
 - Filter
 - Map
 - Union
- Order-sensitive
 - Aggregate
 - Join
 - BSort, Resample
- **Why do we need new operators?**
 - Ops cannot block & cannot accumulate state that grows with input

Filter Example

Input tuples

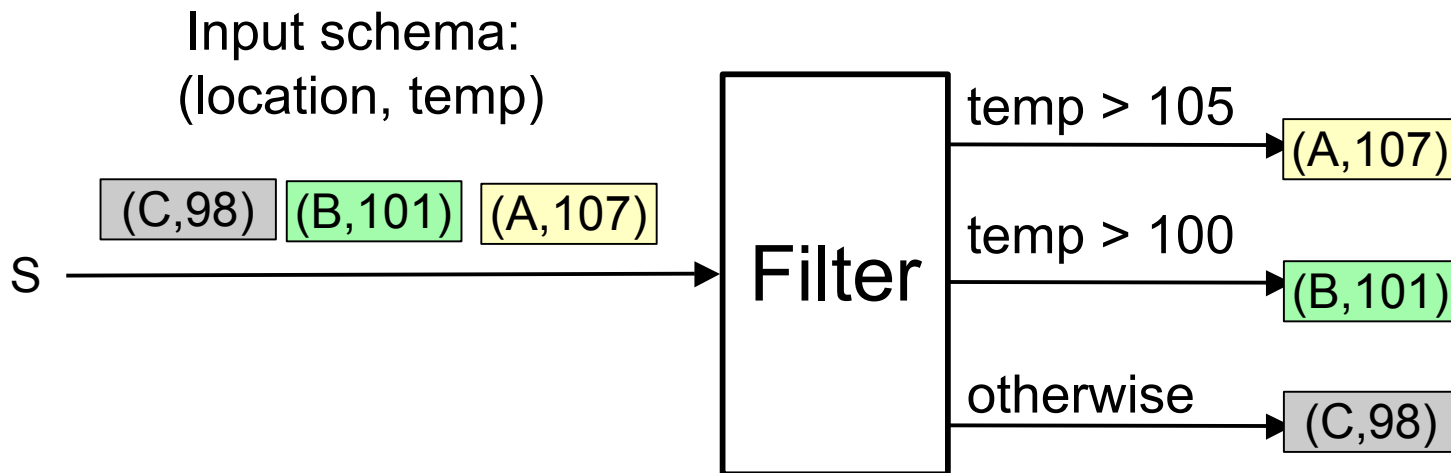

Output tuples

Filter Example

Input tuples

Output tuples

Map Example

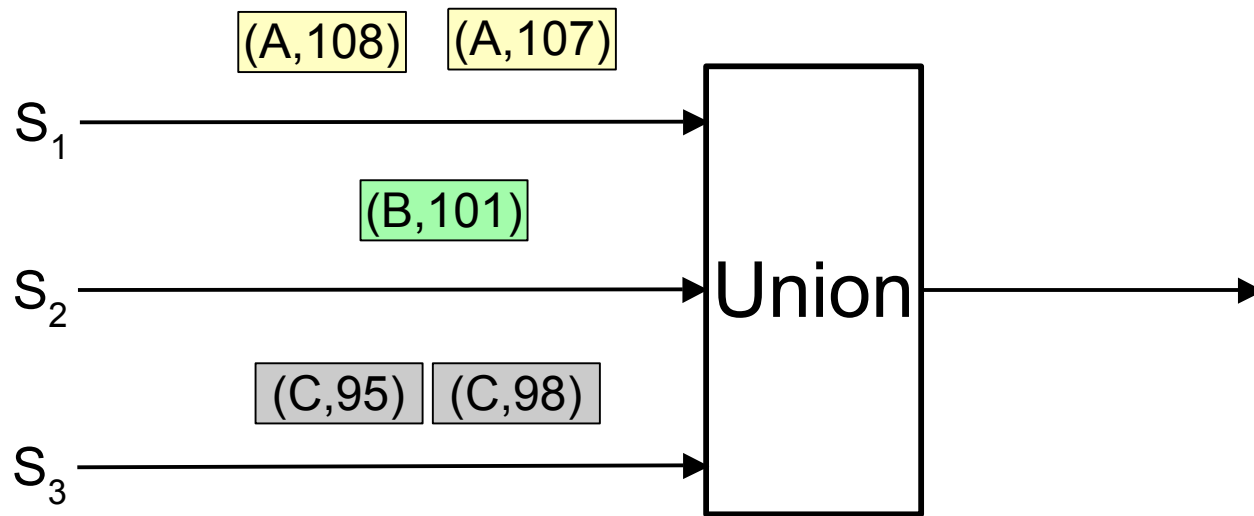

new.location = old.location
new.temp_celcius = $5/9 * (\text{old.temp} - 32)$

Map Example

`new.location = old.location`
`new.temp_celcius = 5/9*(old.temp - 32)`

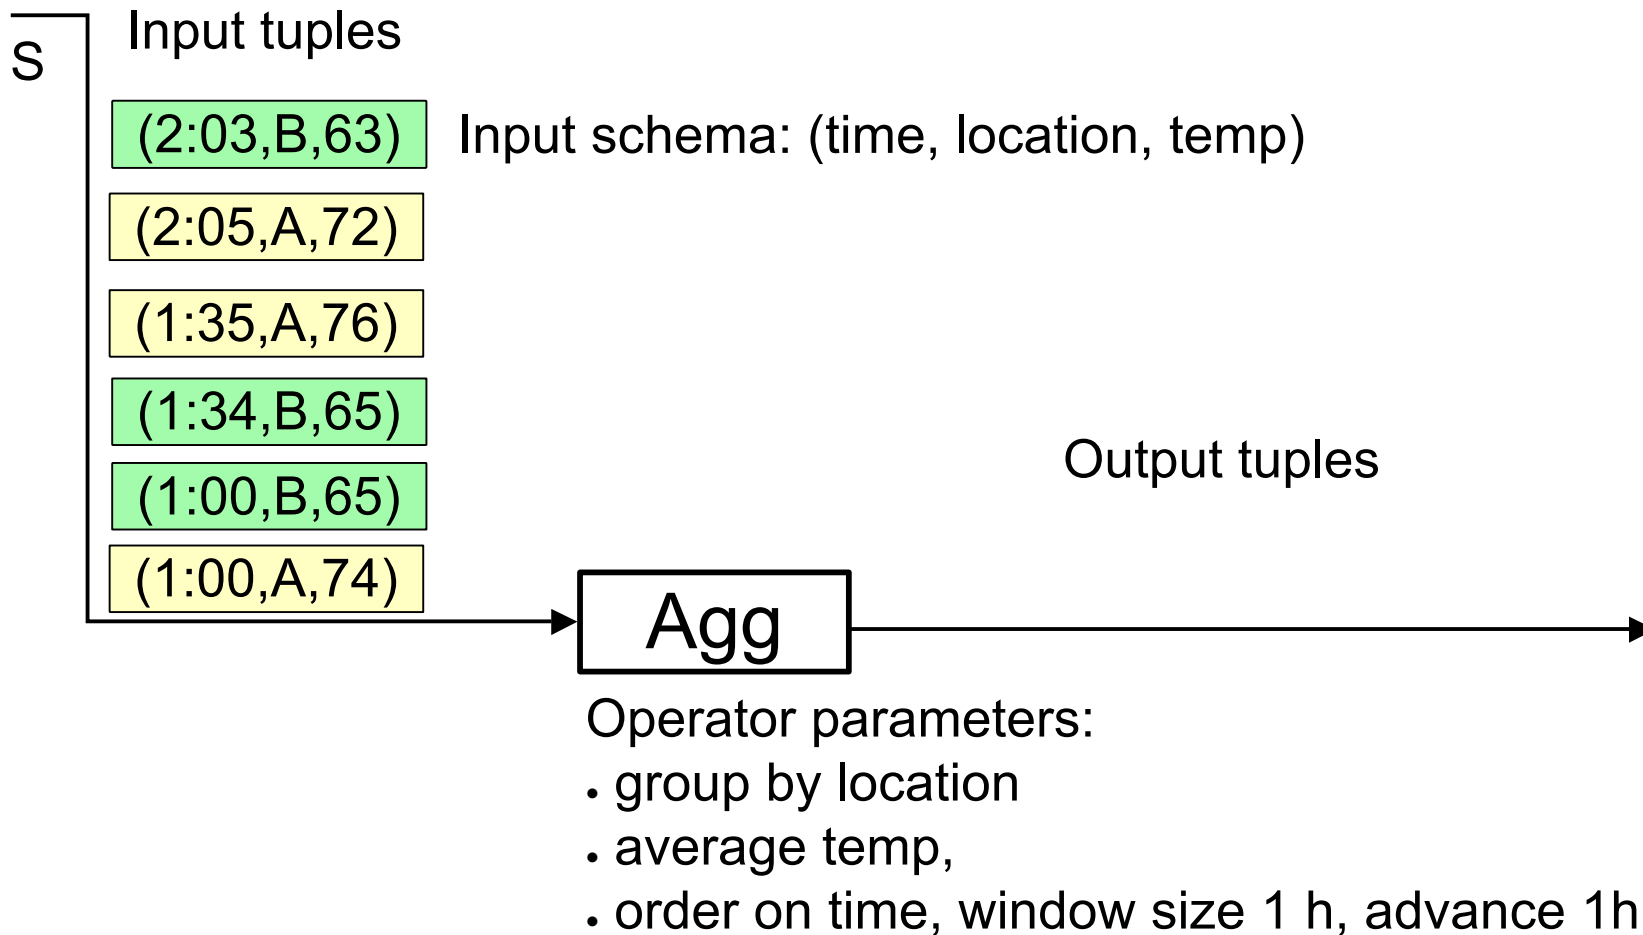

Union Example

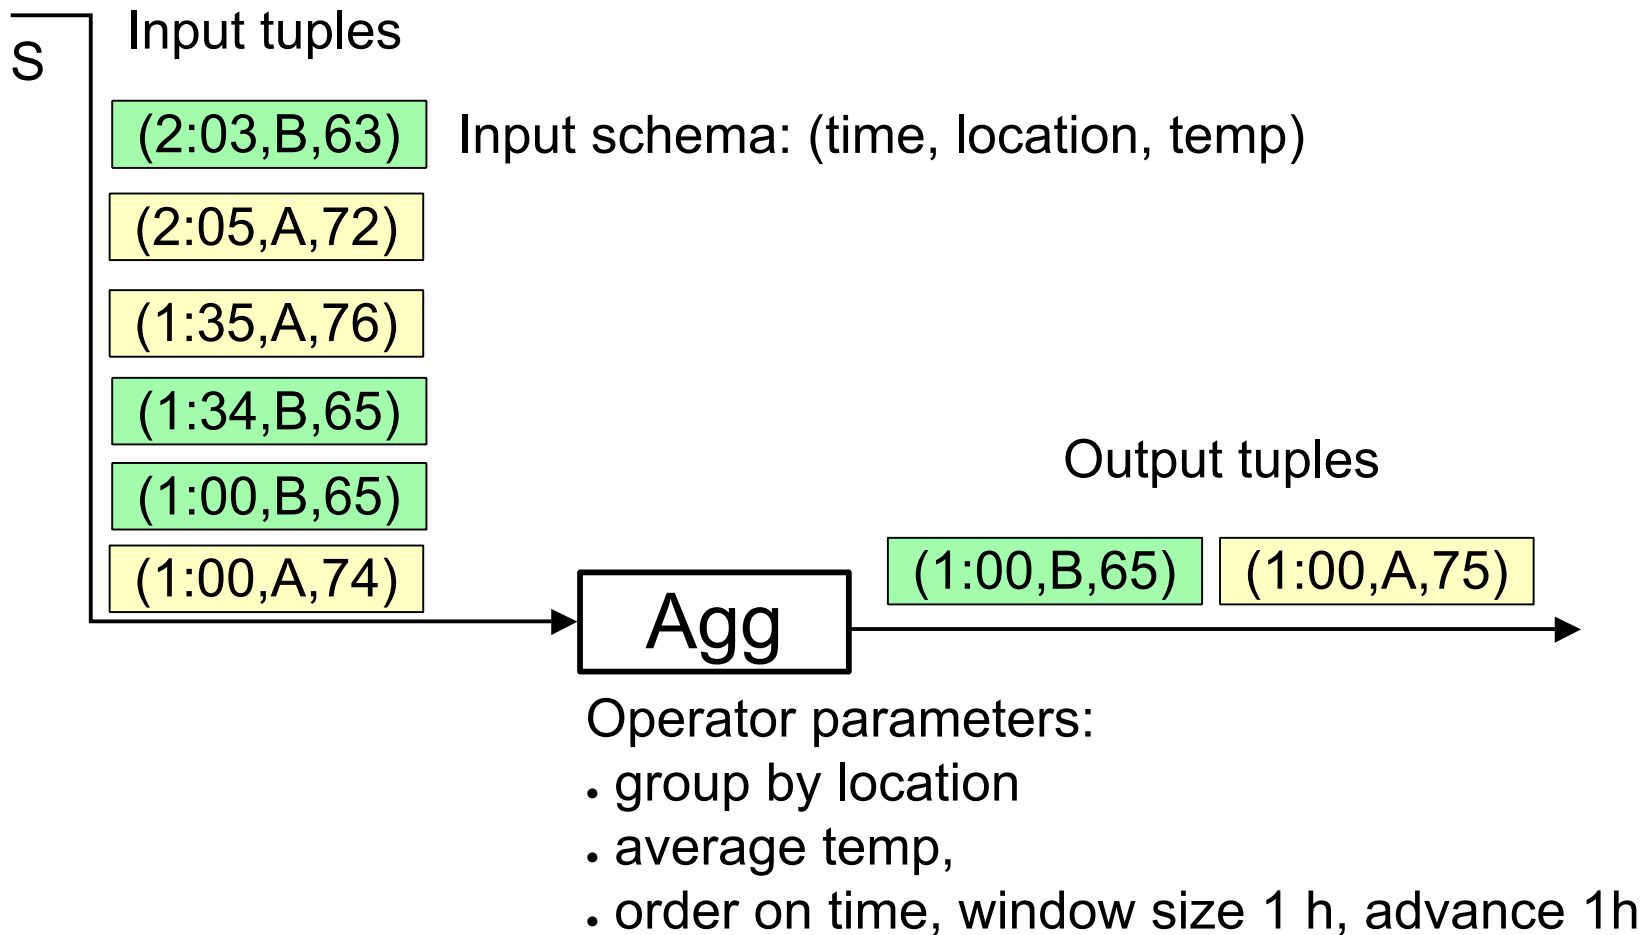

Union Example

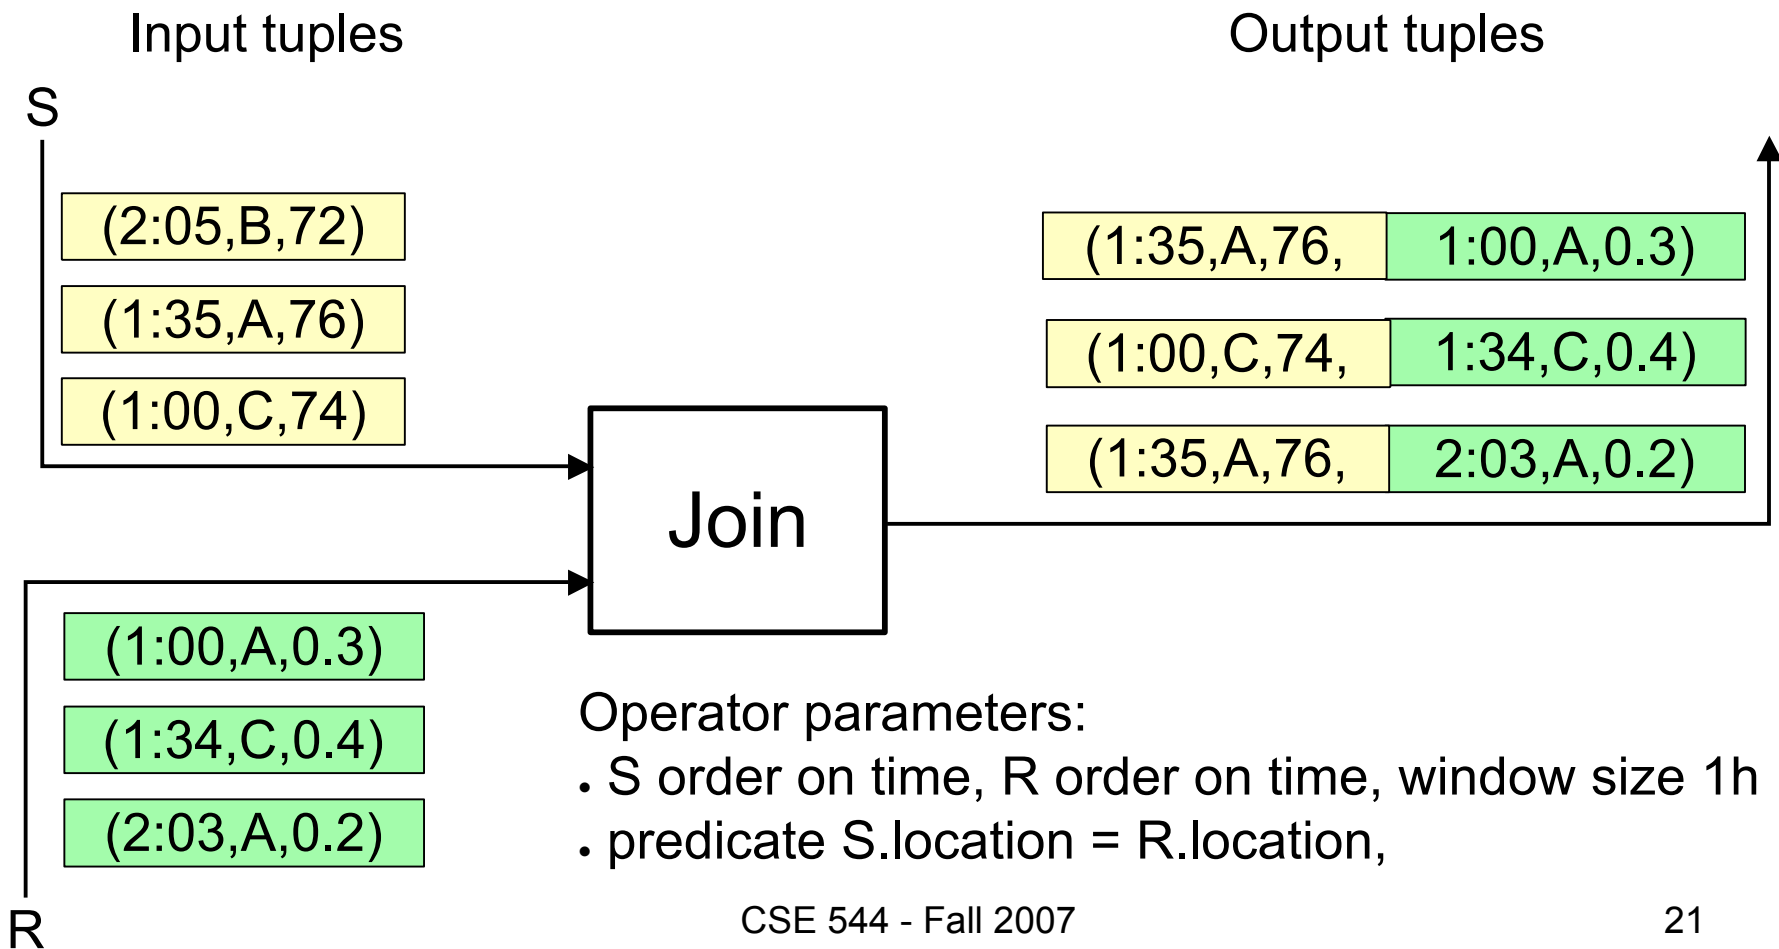

Aggregate Example

Aggregate Example

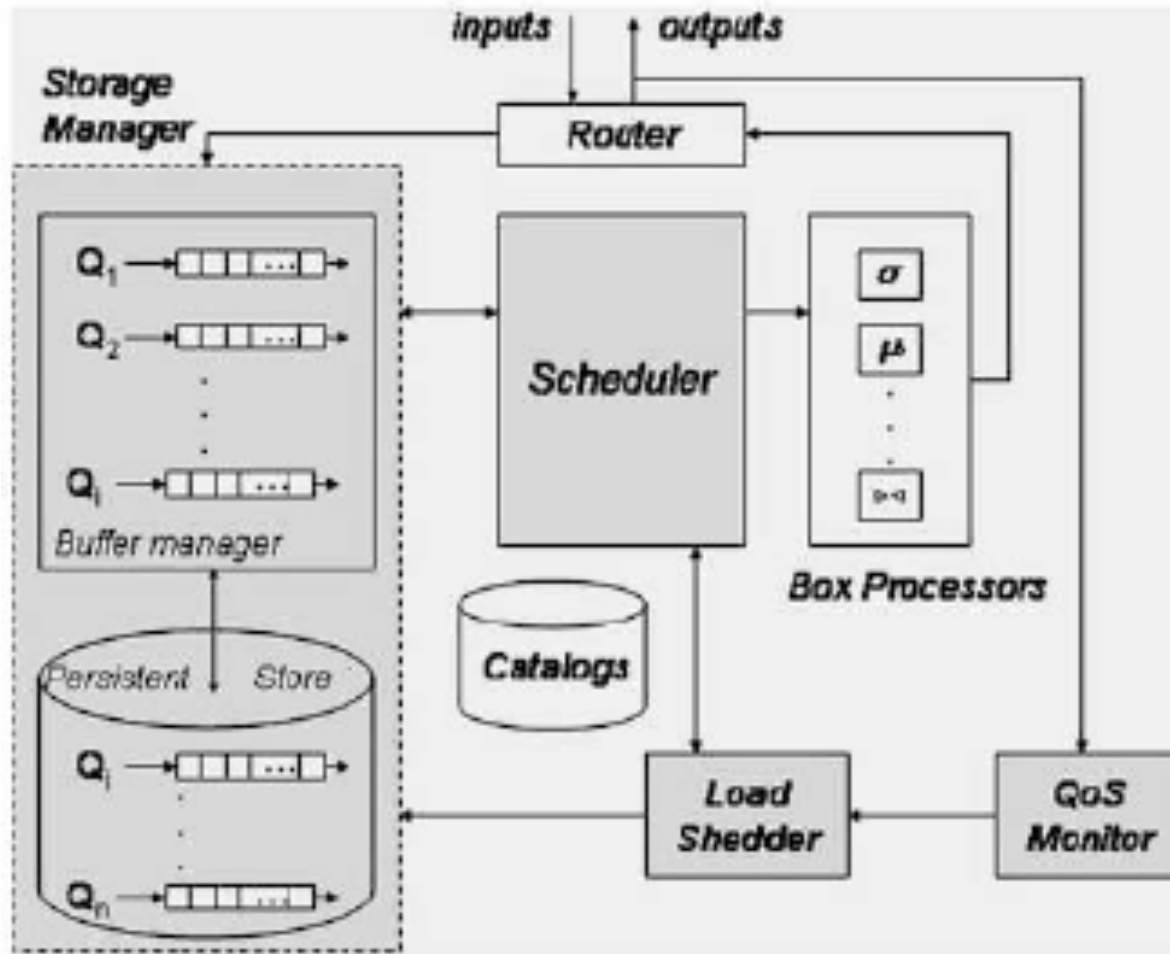

Join Example

Sample Query

- Application: [network intrusion detection](#)
- **Schema of input stream**
`(src_ip, src_port, dst_ip, dst_port, time)`
- **Query**
 - Alert me if an IP address establishes more than 100 connections per minute
 - and within 30 seconds of that event
 - the IP tries to connect to more than 10 distinct ports within a minute

Processing Model

[Figure 3 from Abadi:03]

Additional Features

- **Load management**
 - What happens when system is overloaded?
- **Fault-tolerance**
 - What happens if a node fails?
 - What happens if the network fails?
 - What happens if input data is wrong?
- **Exploiting data archives**
 - Historical queries, ad-hoc queries
 - Integrating push-based processing with pull-based
- ...
