Texture mapping

Texture mapping (Woo et al., fig. 9-1)

Texture mapping allows you to take a simple polygon and give it the appearance of something much more complex.

- Due to Ed Catmull, PhD thesis, 1974
- Refined by Blinn & Newell, 1976

A texture can modulate just about any parameter – diffuse color, specular color, specular exponent,

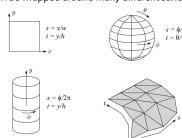

...

Implementing texture mapping

A texture lives in it own abstract image coordinates paramaterized by (s,t) in the range ([0..1], [0..1]):

It can be wrapped around many different surfaces:

With a ray caster, we can do the sphere and cylinder mappings directly (as we will see later). For z-buffers, everything gets converted to a triangle mesh with associated (s,t) coordinates.

Note: if the surface moves/deforms, the texture goes with it.

4

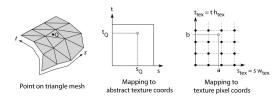

Mapping to texture image coords

The texture is usually stored as an image. Thus, we need to convert from abstract texture coordinate:

(s,t) in the range ([0..1], [0..1])

to texture image coordinates:

 (s_{tex}, t_{tex}) in the range $([0...w_{tex}], [0...h_{tex}])$

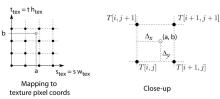

Q: What do you do when the texture sample you need lands between texture pixels?

5

7

Texture resampling

We need to resample the texture:

Thus, we seek to solve for: $T(a,b) = T(i + \Delta_x, j + \Delta_y)$

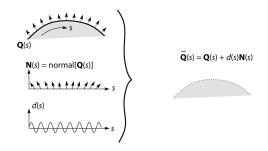

A common choice is bilinear interpolation:

$$\begin{split} \mathsf{T}\big(i+\Delta_{x},j\big) = & & & \mathsf{T}[i,j] & + & & & \mathsf{T}[i+1,j] \\ & \mathsf{T}\big(i+\Delta_{x},j+1\big) = & & & \mathsf{T}[i,j+1] & + & & & \mathsf{T}[i+1,j+1] \\ & & \mathsf{T}\big(i+\Delta_{x},j+\Delta_{y}\big) = & & & \mathsf{T}\big(i+\Delta_{x},j\big) & + & & & & \mathsf{T}\big(i+\Delta_{x},j+1\big) \\ & = & & & \mathsf{T}[i,j] & + & & & & \mathsf{T}[i+1,j] & + \\ & & & & & & & \mathsf{T}[i,j+1] & + & & & & \mathsf{T}[i+1,j+1] \end{split}$$

Displacement mapping

Textures can be used for more than just color.

In **displacement mapping**, a texture is used to perturb the surface geometry itself. Here's the idea in 2D:

- These displacements "animate" with the surface
- In 3D, you would of course have (s,t) parameters instead of just s.

Suppose \mathbf{Q} is a simple surface, like a cube. Will it take more work to render the modified surface \mathbf{Q} ?

Bump mapping

In **bump mapping**, a texture is used to perturb the normal:

- Use the original, simpler geometry, **Q**(s), for hidden surfaces
- Use the normal from the displacement map for shading:

$$\tilde{\mathbf{N}} = \text{normal}[\tilde{\mathbf{Q}}(s)]$$

What artifacts in the images would reveal that bump mapping is a fake?

Displacement vs. bump mapping

Rendered as displacement map over a rectangular surface

Solid textures

Q: What kinds of artifacts might you see from using a marble veneer instead of real marble?

One solution is to use solid textures:

- Use model-space coordinates to index into a 3D texture
- Like "carving" the object from the material

One difficulty of solid texturing is coming up with the textures.

Solid textures (cont'd)

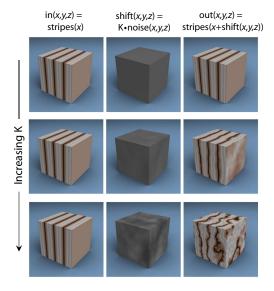

Here's an example for a vase cut from a solid marble texture:

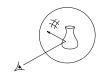

Solid marble texture by Ken Perlin, (Foley, IV-21)

Environment mapping

In **environment mapping** (also known as **reflection mapping**), a texture is used to model an object's environment:

- Rays are bounced off objects into environment
- Color of the environment used to determine color of the illumination
- Environment mapping works well when there is just a single object – or in conjunction with ray tracing

This can be readily implemented (without interreflection) using a fragment shader, where the texture is stored in a "cube map" instead of a sphere.

With a ray tracer, the concept is easily extended to handle refraction as well as reflection (and interreflection).
