Reading

Optional:

• Angel, sections 8.1 – 8.6, 8.8

Further reading:

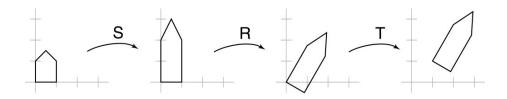

• OpenGL Programming Guide, chapter 3

Symbols and instances

Most graphics APIs support a few geometric **primitives**:

- spheres
- cubes
- cylinders

These symbols are **instanced** using an **instance transformation**.

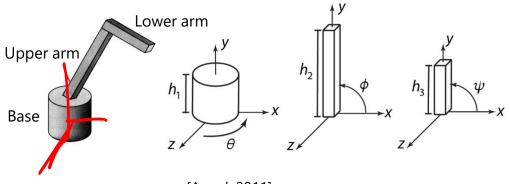

Q: What is the matrix for the instance transformation above?

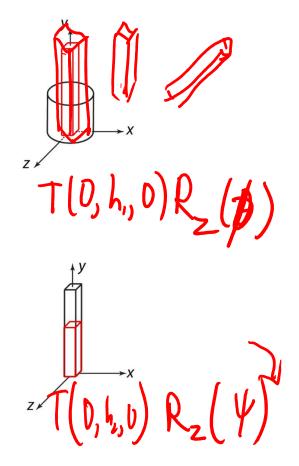

3D Example: A robot arm

Let's build a robot arm out of a cylinder and two cuboids, with the following 3 degrees of freedom:

- Base rotates about its vertical axis by θ
- Upper arm rotates in its *xy*-plane by ϕ
- Lower arm rotates in its *xy*-plane by ψ

[Angel, 2011]

(Note that the angles are set to zero in the figures on the right; i.e., the parts are shown in their "default" positions.)

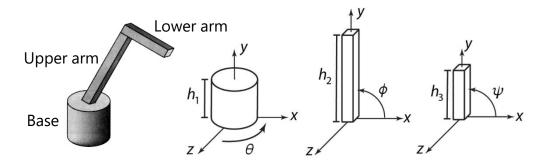

Suppose we have transformations $R_x(\bullet)$, $R_v(\bullet)$, •, •).

Q: What matrix do we use to transform the base? (0) T(0, h,, 0) R.

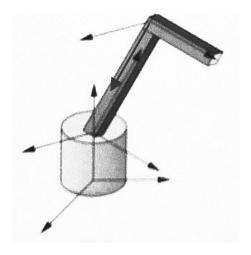

Q: What matrix product for the upper arm?

3D Example: A robot arm

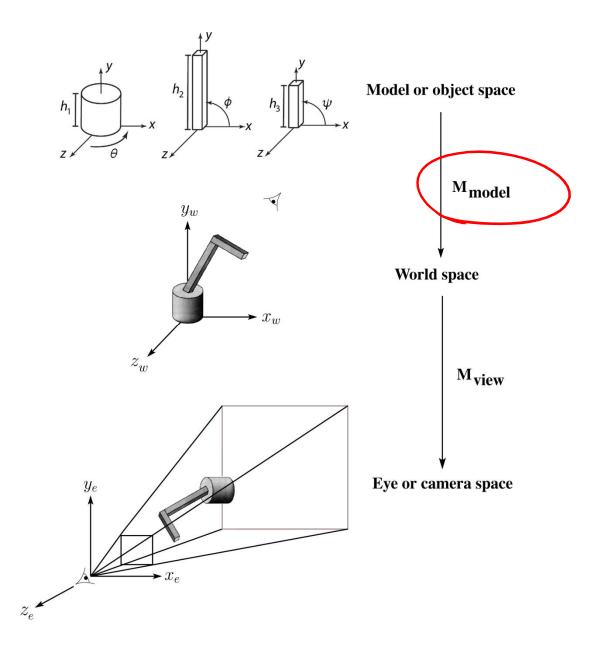

An alternative interpretation is that we are taking the original coordinate frames...

...and translating and rotating them into place:

From parts to model to viewer

Robot arm implementation

The robot arm can be displayed by keeping a global matrix and computing it at each step:

```
Matrix M, M_model, M_view;
main()
{
    . . .
    M view = compute view transform();
    robot_arm();
    . . .
}
robot arm()
                                 Transform for base
{
    M model = R y(theta);
    M = M_view*M_model;
    base();
    M \mod l = R y(\text{theta}) * T(0,h1,0) * R z(phi);
    M = M view*M model;
    upper arm();
    M_model = R_y(theta) *T(0,h1,0) *R_z(phi) *T(0,h2,0) *R_z(psi);
    M = M view*M model;
    lower arm();
}
```

Do the matrix computations seem wasteful?

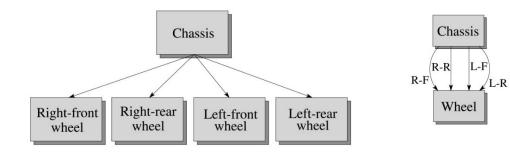

Robot arm implementation, better

Instead of recalculating the global matrix each time, we can just update it *in place* by concatenating matrices on the right:

```
Matrix M_modelview;
main()
{
    . . .
    M_modelview = compute_view_transform();
    robot_arm();
    • • •
}
robot arm()
{
                                         Mr IR2
    M_modelview *= R_y(theta);
    base();
    M modelview *= T(0,h1,0) *R z(phi);
    upper_arm();
    M modelview *= T(0,h2,0) *R z(psi);
    lower arm();
}
```

Hierarchical modeling

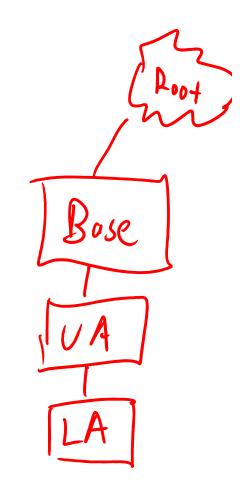

Hierarchical models can be composed of instances using trees or DAGs:

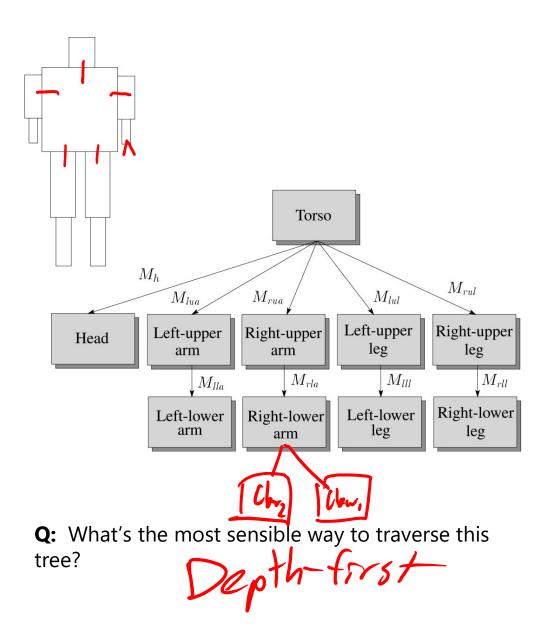

- edges contain geometric transformations
- nodes contain geometry (and possibly drawing attributes)

We will use trees for hierarchical models.

How might we draw the tree for the robot arm?

A complex example: human figure

Using canonical primitives

Consider building the robot arm again, but this time the building blocks are canonical primitives like a unit cylinder and a unit cube.

What additional transformations are needed? What does the hierarchy look like now? Bose breo Canonical X 1 primitives 7 Unit cylinder Unit cube UA Go Lower arm Upper arm h_2 Base w, Ζ Z¥ ZI

Animation

The above examples are called **articulated models**:

- rigid parts
- connected by joints

They can be animated by specifying the joint angles (or other display parameters) as functions of time.

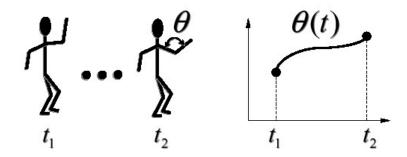

Key-frame animation

The most common method for character animation in production is **key-frame animation**.

- Each joint specified at various **key frames** (not necessarily the same as other joints)
- System does interpolation or in-betweening

Doing this well requires:

- A way of smoothly interpolating key frames: splines
- A good interactive system
- A lot of skill on the part of the animator

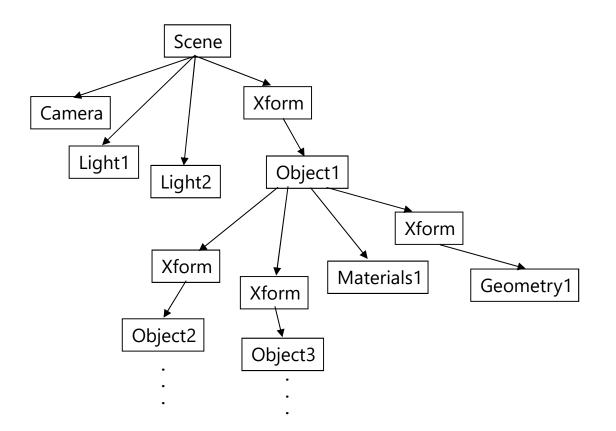

Scene graphs

The idea of hierarchical modeling can be extended to an entire scene, encompassing:

- many different objects
- lights
- camera position

This is called a **scene tree** or **scene graph**.

Summary

Here's what you should take home from this lecture:

- All the **boldfaced terms**.
- How primitives can be instanced and composed to create hierarchical models using geometric transforms.
- How the notion of a model tree or DAG can be extended to entire scenes.
- How OpenGL transformations can be used in hierarchical modeling.
- How keyframe animation works.
