# **Parametric surfaces**

Brian Curless CSE 557 Autumn 2017

# Reading

#### Optional reading:

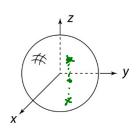

- ◆ Angel and Shreiner readings for "Parametric Curves" lecture, with emphasis on 10.1.2, 10.1.3, 10.1.5, 10.6.2, 10.7.3, 10.9.4.
- Marschner and Shirley, 2.5.

### Further reading

◆ Bartels, Beatty, and Barsky. *An Introduction to Splines for use in Computer Graphics and Geometric Modeling,* 1987.

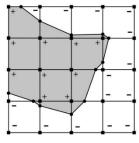

# **Mathematical surface representations**

- Explicit z = f(x, y) (a.k.a., a "height field")
  - what if the curve isn't a function, like a sphere?

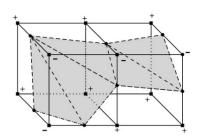

• Implicit g(x, y, z) = 0

Isocontour from "marching squares"

Isocontour from "marching cubes"

- Parametric S(u, v) = (x(u, v), y(u, v), z(u, v))
  - For the sphere:

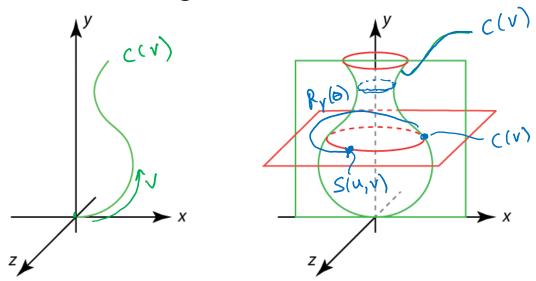

$$x(u, v) = r \cos(2\pi v) \sin(\pi u)$$
$$y(u, v) = r \sin(2\pi v) \sin(\pi u)$$

$$z(u, v) = r \cos(\pi u)$$

 $\phi = 2\pi \sqrt{y}$ 

As with curves, we'll focus on parametric surfaces.

# **Constructing surfaces of revolution**

**Given:** A curve C(v) in the xy-plane:

$$C(v) = \begin{bmatrix} C_x(v) \\ C_y(v) \\ 0 \\ \overline{(1)} \end{bmatrix}$$

Let  $R_{\nu}(\theta)$  be a rotation about the *y*-axis.

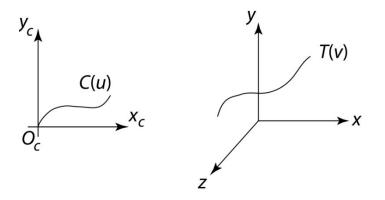

**Find:** A surface S(u,v) which is C(v) rotated about the *y*-axis, where  $u,v \in [0, 1]$ .

Solution:  $R_{\nu}(2\pi u) \subset (\nu)$ 

### **General sweep surfaces**

The **surface of revolution** is a special case of a **swept** surface.

Idea: Trace out surface S(u, v) by moving a **profile** curve C(u) along a **trajectory** curve T(v).

#### More specifically:

- Suppose that C(u) lies in an  $(x_c, y_c)$  coordinate system with origin  $O_c$ .
- For every point along T(v), lay C(u) so that  $O_c$  coincides with T(v).

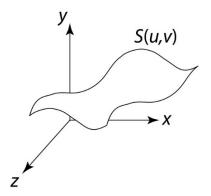

### Orientation

The big issue:

• How to orient C(u) as it moves along T(v)?

Here are two options:

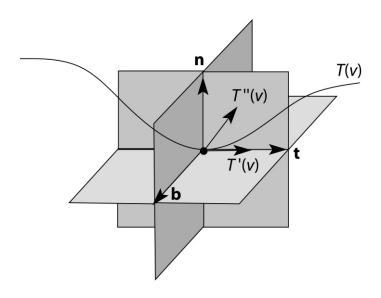

1. **Fixed** (or **static**): Just translate  $O_c$  along T(v).

- 2. Moving. Use the **Frenet frame** of T(v).
  - Allows smoothly varying orientation.
  - Permits surfaces of revolution, for example.

#### **Frenet frames**

Motivation: Given a curve T(v), we want to attach a smoothly varying coordinate system.

To get a 3D coordinate system, we need 3 independent direction vectors.

Tangent:  $\mathbf{t}(v) = \text{normalize}[T'(v)]$ 

Binormal:  $\mathbf{b}(v) = \text{normalize}[T'(v) \times T''(v)]$ 

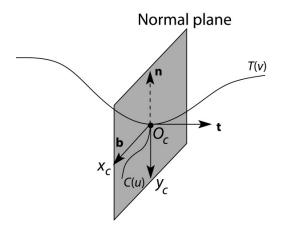

Normal:  $\mathbf{n}(v) = \mathbf{b}(v) \times \mathbf{t}(v)$ 

As we move along T(v), the Frenet frame (t, b, n) varies smoothly.

# Frenet swept surfaces

Orient the profile curve C(u) using the Frenet frame of the trajectory T(v):

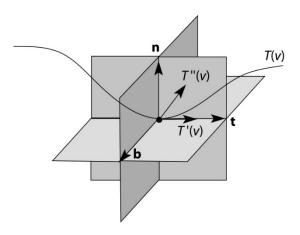

- Put C(u) in the **normal plane**.
- Place  $O_c$  on T(v).
- Align  $x_c$  for C(u) with **b**.
- Align  $y_c$  for C(u) with  $-\mathbf{n}$ .

If T(v) is a circle, you get a surface of revolution exactly!

# **Degenerate frames**

Let's look back at where we computed the coordinate frames from curve derivatives:

Where might these frames be ambiguous or undetermined?

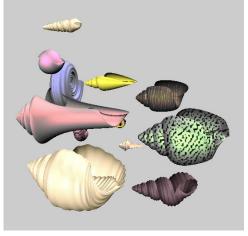

### **Variations**

Several variations are possible:

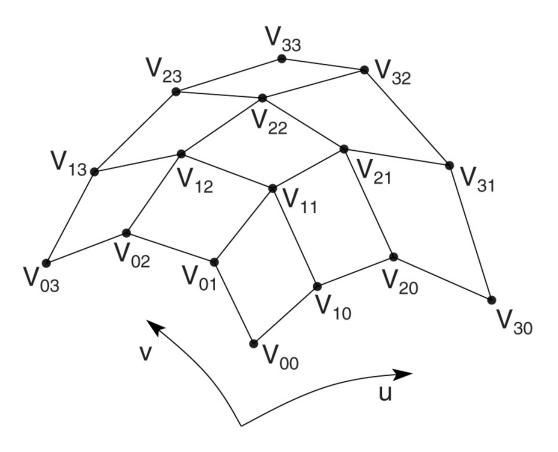

- ◆ Scale *C*(*u*) as it moves, possibly using length of *T*(*v*) as a scale factor.
- Morph C(u) into some other curve  $\tilde{C}(u)$  as it moves along T(v).

**\*** ...

### **Tensor product Bézier surfaces**

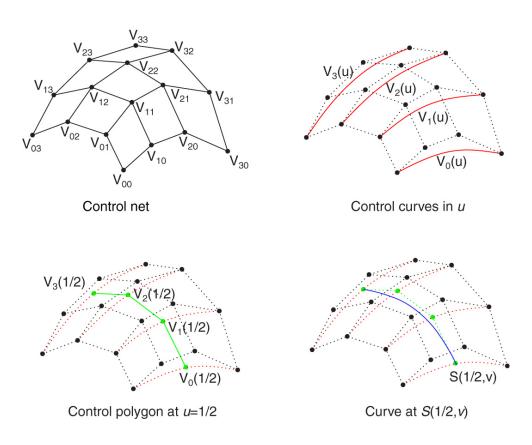

Given a grid of control points  $V_{ij}$ , forming a **control net**, construct a surface S(u, v) by:

- treating rows of V (the matrix consisting of the  $V_{ij}$ ) as control points for curves  $V_0(u), \ldots, V_n(u)$ .
- treating  $V_0(u),...,V_n(u)$  as control points for a curve parameterized by v.

# Tensor product Bézier surfaces, cont.

Let's walk through the steps:

Which control points are always interpolated by the surface?

# Polynomial form of Bézier surfaces

Recall that cubic Bézier *curves* can be written in terms of the Bernstein polynomials:

$$Q(u) = \sum_{i=0}^{n} V_i b_i(u)$$

A tensor product Bézier surface can be written as:

$$S(u,v) = \sum_{i=0}^{n} \sum_{j=0}^{n} V_{ij} b_{i}(u) b_{j}(v)$$

In the previous slide, we constructed curves along u, and then along v. This corresponds to re-grouping the terms like so:

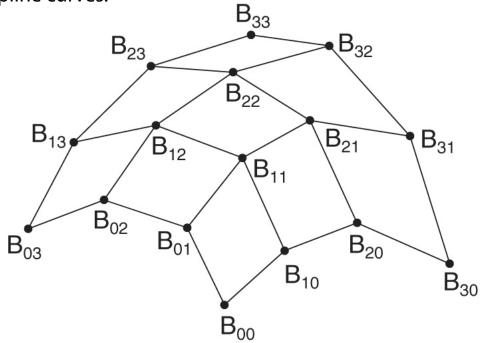

$$S(u,v) = \sum_{j=0}^{n} \left( \sum_{i=0}^{n} V_{ij} b_{i}(u) \right) b_{j}(v)$$

But, we could have constructed them along v, then u:

$$S(u,v) = \sum_{i=0}^{n} \left( \sum_{j=0}^{n} V_{ij} b_{j}(v) \right) b_{i}(u)$$

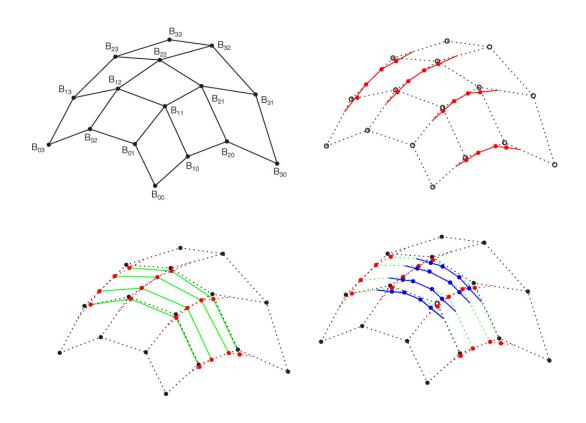

## **Tensor product B-spline surfaces**

As with spline curves, we can piece together a sequence of Bézier surfaces to make a spline surface. If we enforce  $C^2$  continuity and local control, we get B-spline curves:

- treat rows of B as control points to generate Bézier control points in u.
- ◆ treat Bézier control points in *u* as B-spline control points in *v*.
- ◆ treat B-spline control points in v to generate Bézier control points in u.

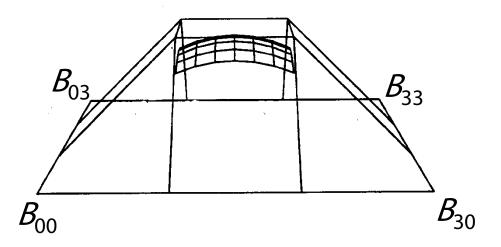

# Tensor product B-spline surfaces, cont.

Which B-spline control points are always interpolated by the surface?

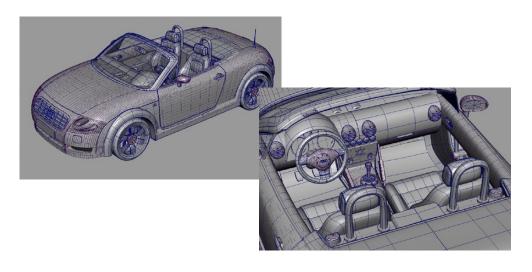

# Tensor product B-splines, cont.

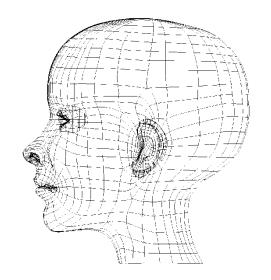

Another example:

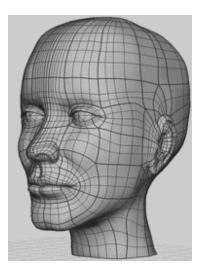

# **NURBS** surfaces

Uniform B-spline surfaces are a special case of NURBS surfaces.

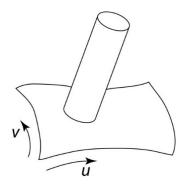

### **Trimmed NURBS surfaces**

Sometimes, we want to have control over which parts of a NURBS surface get drawn.

#### For example:

We can do this by **trimming** the u-v domain.

- ◆ Define a closed curve in the *u-v* domain (a **trim** curve)
- Do not draw the surface points inside of this curve.

It's really hard to maintain continuity in these regions, especially while animating.

# **Summary**

#### What to take home:

- How to construct swept surfaces from a profile and trajectory curve:
  - with a fixed frame
  - · with a Frenet frame
- How to construct tensor product Bézier surfaces
- How to construct tensor product B-spline surfaces
