

## CSE-571 Robotics

**Planning and Control:**  
**Markov Decision Processes**

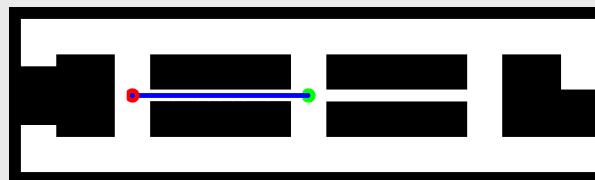

1

## Problem Classes

- Deterministic vs. stochastic actions
- Full vs. partial observability

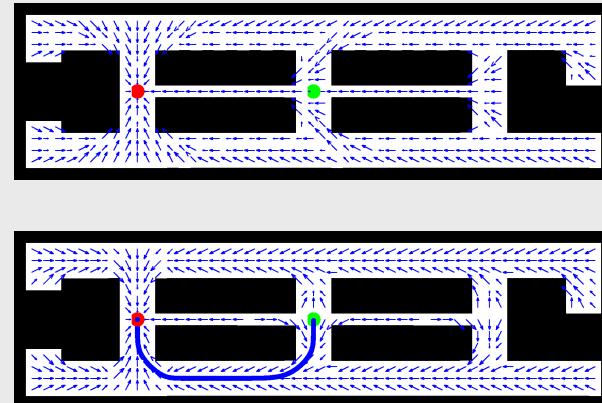

2

## Deterministic, fully observable

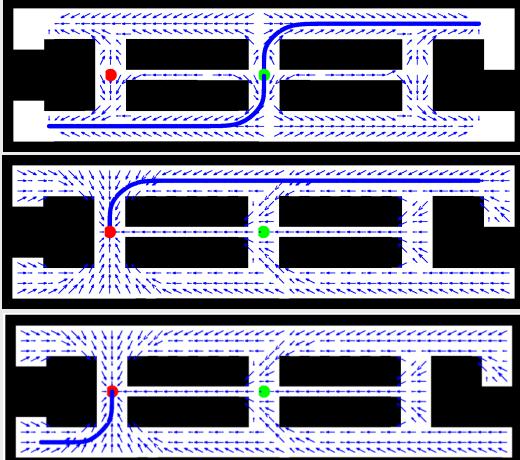

3

## Stochastic, Fully Observable

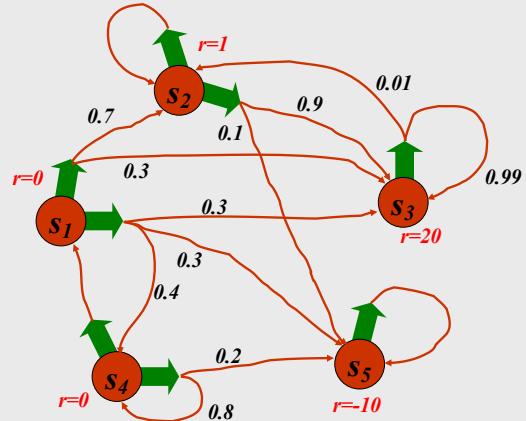

4

## Stochastic, Partially Observable

5

## Markov Decision Process (MDP)

6

## Markov Decision Process (MDP)

- **Given:**
- States  $x$
- Actions  $u$
- Transition probabilities  $p(x'|u,x)$
- Reward / payoff function  $r(x,u)$
  
- **Wanted:**
- Policy  $\pi(x)$  that maximizes the future expected reward

7

## Rewards and Policies

- Policy (general case):  

$$\pi: z_{1:t-1}, u_{1:t-1} \rightarrow u_t$$
- Policy (fully observable case):  

$$\pi: x_t \rightarrow u_t$$
- Expected cumulative payoff:  

$$R_T = E \left[ \sum_{\tau=1}^T \gamma^\tau r_{t+\tau} \right]$$
  - T=1: greedy policy
  - T>1: finite horizon case, typically no discount
  - T=infty: infinite-horizon case, finite reward if discount < 1

8

2

## Policies contd.

- Expected cumulative payoff of policy:

$$R_T^\pi(x_t) = E \left[ \sum_{\tau=1}^T \gamma^\tau r_{t+\tau} | u_{t+\tau} = \pi(z_{1:t+\tau-1} u_{1:t+\tau-1}) \right]$$

- Optimal policy:

$$\pi^* = \operatorname{argmax}_\pi R_T^\pi(x_t)$$

- 1-step optimal policy:

$$\pi_1(x) = \operatorname{argmax}_u r(x, u)$$

- Value function of 1-step optimal policy:

$$V_1(x) = \gamma \max_u r(x, u)$$

9

## 2-step Policies

- Optimal policy:

$$\pi_2(x) = \operatorname{argmax}_u \left[ r(x, u) + \int V_1(x') p(x' | u, x) dx' \right]$$

- Value function:

$$V_2(x) = \gamma \max_u \left[ r(x, u) + \int V_1(x') p(x' | u, x) dx' \right]$$

10

## T-step Policies

- Optimal policy:

$$\pi_T(x) = \operatorname{argmax}_u \left[ r(x, u) + \int V_{T-1}(x') p(x' | u, x) dx' \right]$$

- Value function:

$$V_T(x) = \gamma \max_u \left[ r(x, u) + \int V_{T-1}(x') p(x' | u, x) dx' \right]$$

11

## Infinite Horizon

- Optimal policy:

$$V_\infty(x) = \gamma \max_u \left[ r(x, u) + \int V_\infty(x') p(x' | u, x) dx' \right]$$

- Bellman equation

- Fix point is optimal policy

- Necessary and sufficient condition

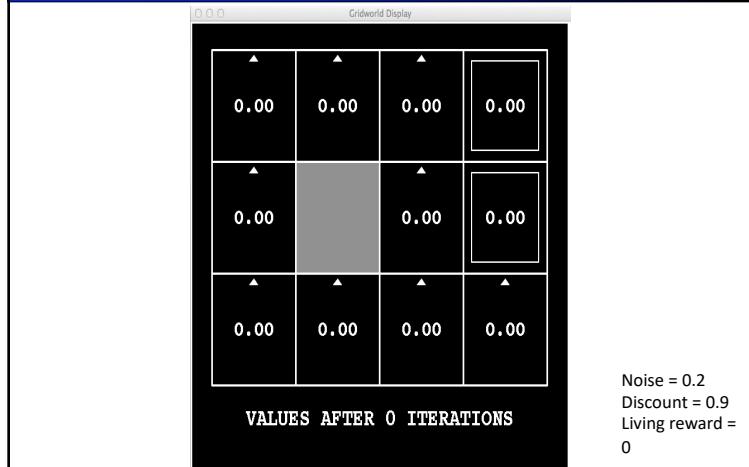

12

## Value Iteration

- for all  $x$  do  
 $\hat{V}(x) \leftarrow r_{\min}$
  - endfor
  - repeat until convergence
    - for all  $x$  do  
 $\hat{V}(x) \leftarrow \gamma \max_u \left[ r(x,u) + \int \hat{V}(x') p(x'|u,x) dx' \right]$
    - endfor
  - endrepeat
- $$\pi(x) = \operatorname{argmax}_u \left[ r(x,u) + \int \hat{V}(x') p(x'|u,x) dx' \right]$$

27

## Value Function and Policy

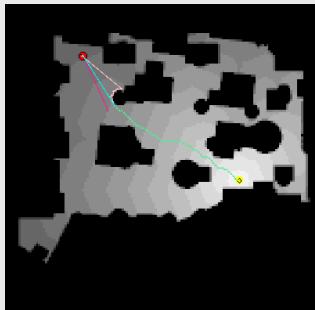

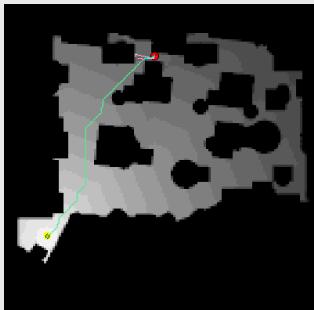

- Each step takes  $O(|A| |S| |S|)$  time.
- Number of iterations required is polynomial in  $|S|$ ,  $|A|$ ,  $1/(1-\gamma)$

28

## Value Iteration for Motion Planning

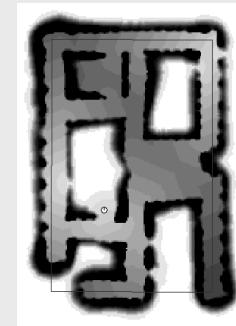

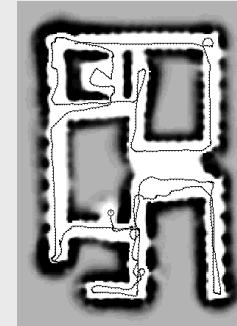

(assumes knowledge of robot's location)

29

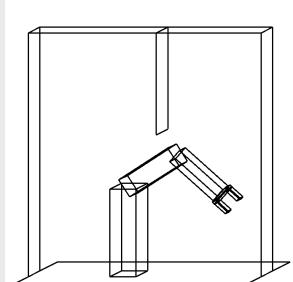

## Frontier-based Exploration

- Every unknown location is a target point.

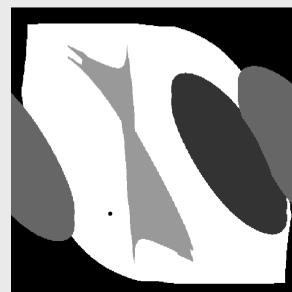

30

## Manipulator Control

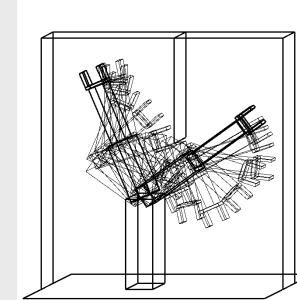

Arm with two joints

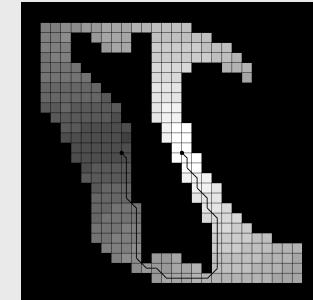

Configuration space

31

## Manipulator Control Path

## POMDPs

- In POMDPs we apply the very same idea as in MDPs.
- Since the **state is not observable**, the agent has to **make its decisions based on the belief state** which is a posterior distribution over states.
- For finite horizon problems, the resulting value functions are piecewise linear and convex.
- In each iteration the **number of linear constraints grows exponentially**.
- Full fledged POMDPs have only been applied to very small state spaces with small numbers of possible observations and actions.
- **Approximate solutions are becoming more and more capable.**
