Deterministic Path Planning in Robotics

Courtesy of Maxim Likhachev

Carnegie Mellon University

Motion/Path Planning

- Task:
 - find a feasible (and cost-minimal) path/motion from the current configuration of the robot to its goal configuration (or one of its goal configurations)
- Two types of constraints:
 - environmental constraints (e.g., obstacles)
 - dynamics/kinematics constraints of the robot
- Generated motion/path should (objective):
 - be any feasible path
 - minimize cost such as distance, time, energy, risk, ...

Motion/Path Planning

Examples (of what is usually referred to as path planning):

Motion/Path Planning

Examples (of what is usually referred to as motion planning):

Piano Movers' problem

the example above is borrowed from www.cs.cmu.edu/~awm/tutorials

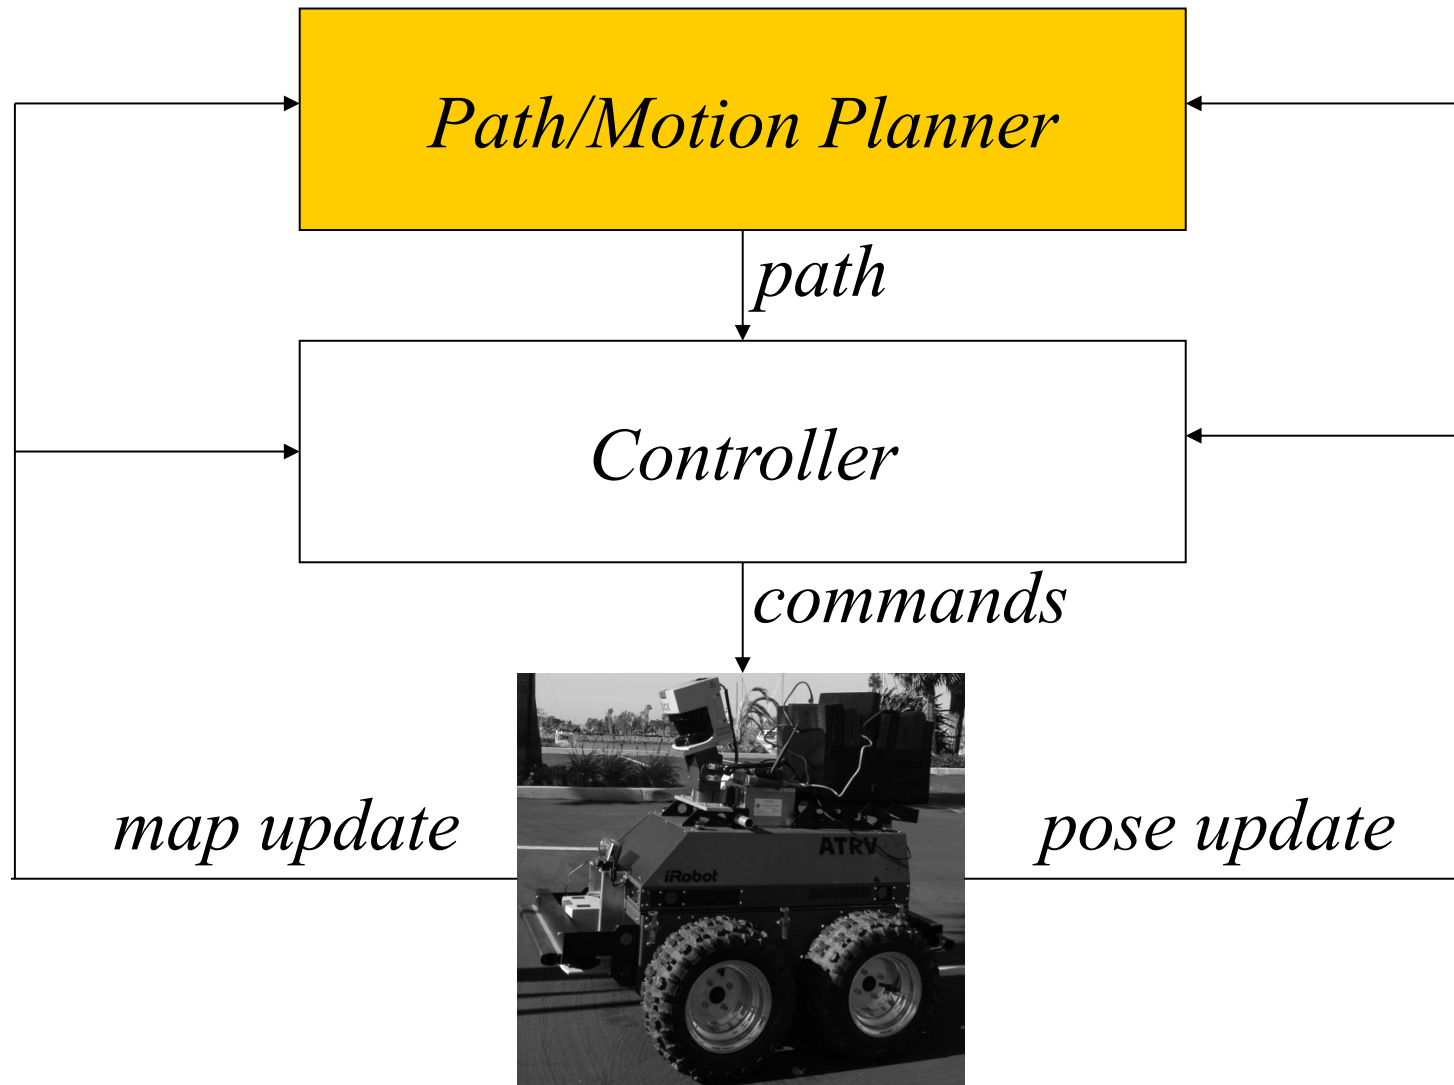

Motion/Path Planning

Examples (of what is usually referred to as motion planning):

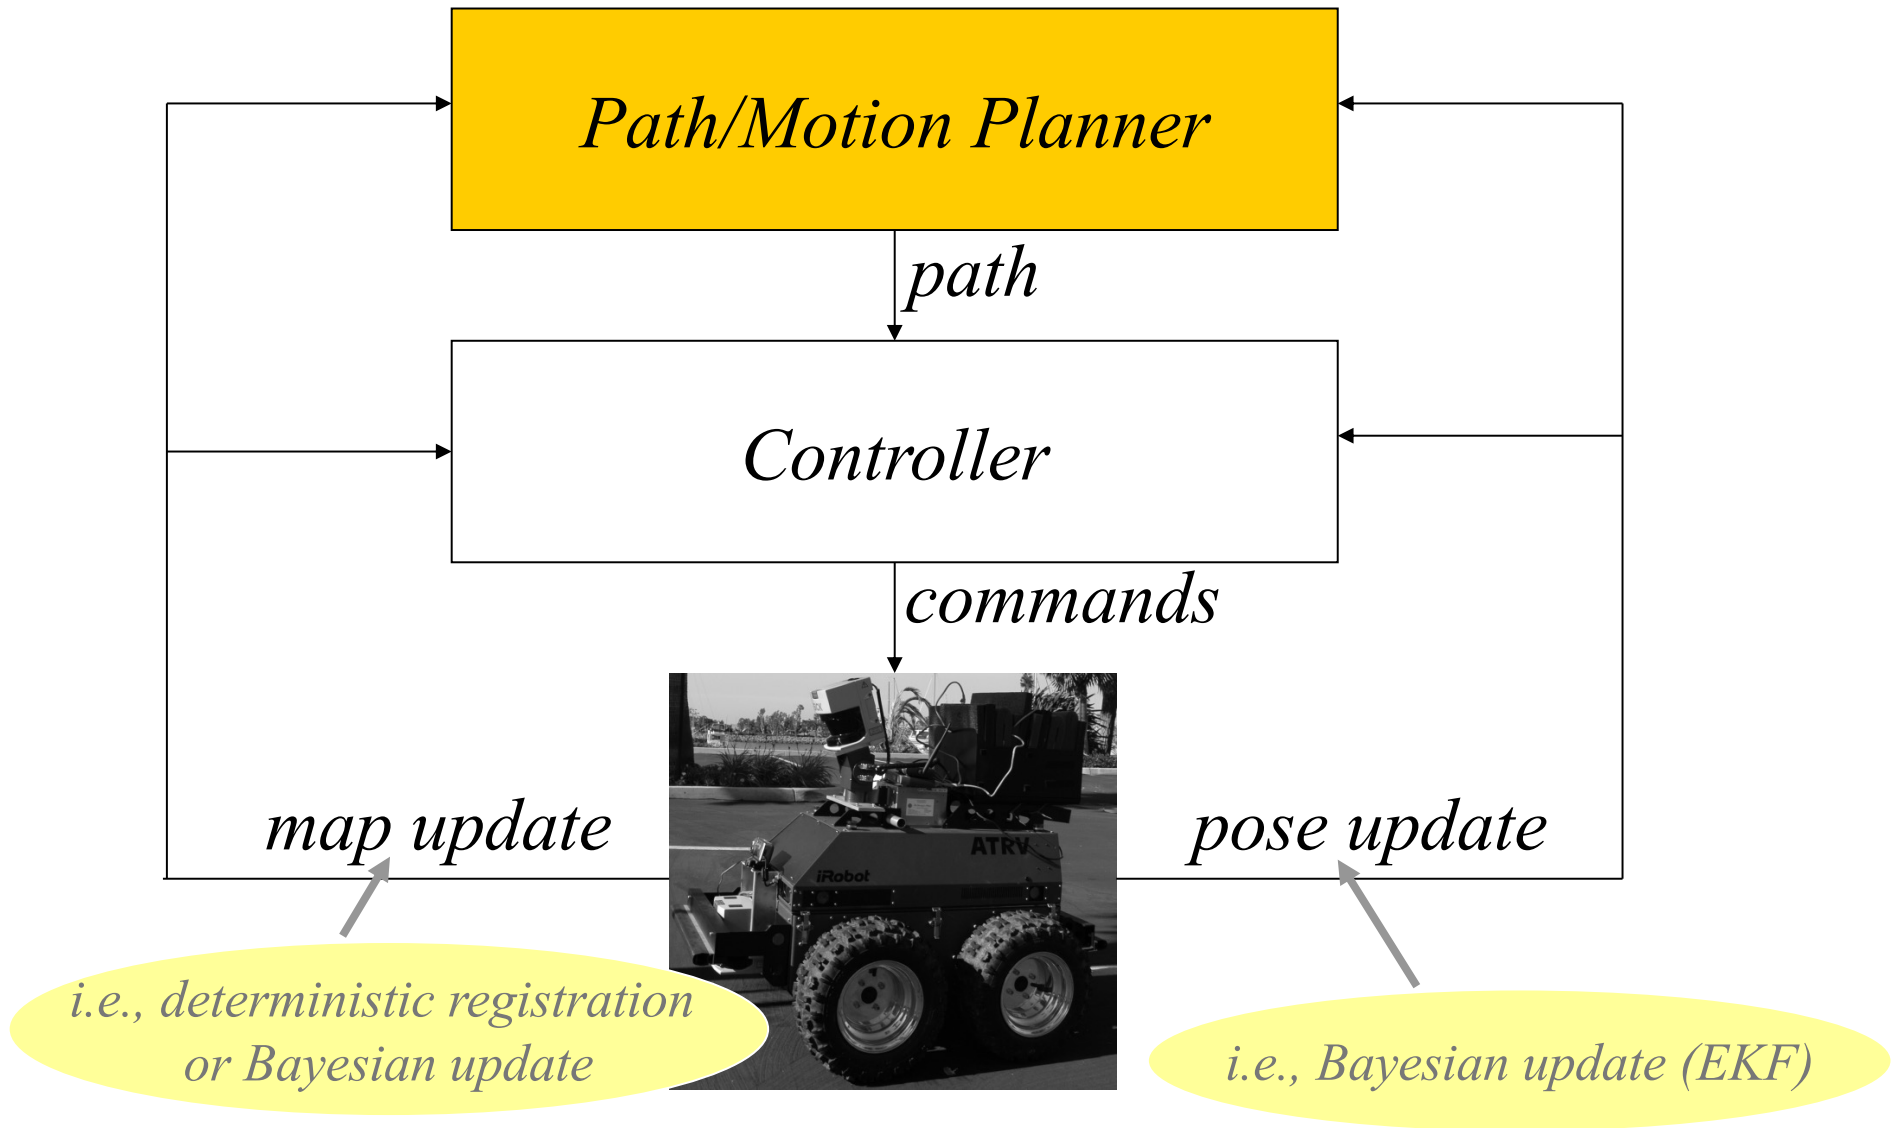

Planned motion for a 6DOF robot arm

Motion/Path Planning

Motion/Path Planning

Uncertainty and Planning

- Uncertainty can be in:
 - prior environment (i.e., door is open or closed)
 - execution (i.e., robot may slip)
 - sensing environment (i.e., seems like an obstacle but not sure)
 - pose
- Planning approaches:
 - deterministic planning:
 - assume some (i.e., most likely) environment, execution, pose
 - plan a single least-cost trajectory under this assumption
 - re-plan as new information arrives
 - planning under uncertainty:
 - associate probabilities with some elements or everything
 - plan a policy that dictates what to do for each outcome of sensing/action and minimizes expected cost-to-goal
 - re-plan if unaccounted events happen

Uncertainty and Planning

- Uncertainty can be in:
 - prior environment (i.e., door is open or closed)
 - execution (i.e., robot may slip)
 - sensing environment (i.e., seems like an obstacle but not sure)
 - pose
- Planning approaches:
 - deterministic planning:
 - assume some (i.e., most likely) environment,
 - plan a single least-cost trajectory under this assumption
 - re-plan as new information arrives
 - planning under uncertainty:
 - associate probabilities with some elements or everything
 - plan a policy that dictates what to do for each outcome of sensing/action and minimizes expected cost-to-goal
 - re-plan if unaccounted events happen

*re-plan every time
sensory data arrives or
robot deviates off its path*

re-planning needs to be FAST

Uncertainty and Planning

- Uncertainty can be in:
 - prior environment (i.e., door is open or closed)
 - execution (i.e., robot may slip)
 - sensing environment (i.e., seems like an obstacle but not sure)
 - pose
- Planning approaches:
 - deterministic planning:
 - assume some (i.e., most likely) environment, execution, pose
 - plan a single least-cost trajectory under this assumption
 - re-plan as new information arrives
 - planning under uncertainty:
 - associate probabilities with some elements or everything
 - plan a policy that dictates what to do for each outcome of sensing/action and minimizes expected cost-to-goal
 - re-plan if unaccounted events happen *computationally MUCH harder*

Example

*Urban Challenge Race, CMU team, planning with Anytime D**

Outline

- Deterministic planning
 - constructing a graph
 - search with A*
 - search with D*

Outline

- Deterministic planning
 - constructing a graph
 - search with A*
 - search with D*

Planning via Cell Decomposition

- Approximate Cell Decomposition:
 - overlay uniform grid over the C-space (discretize)

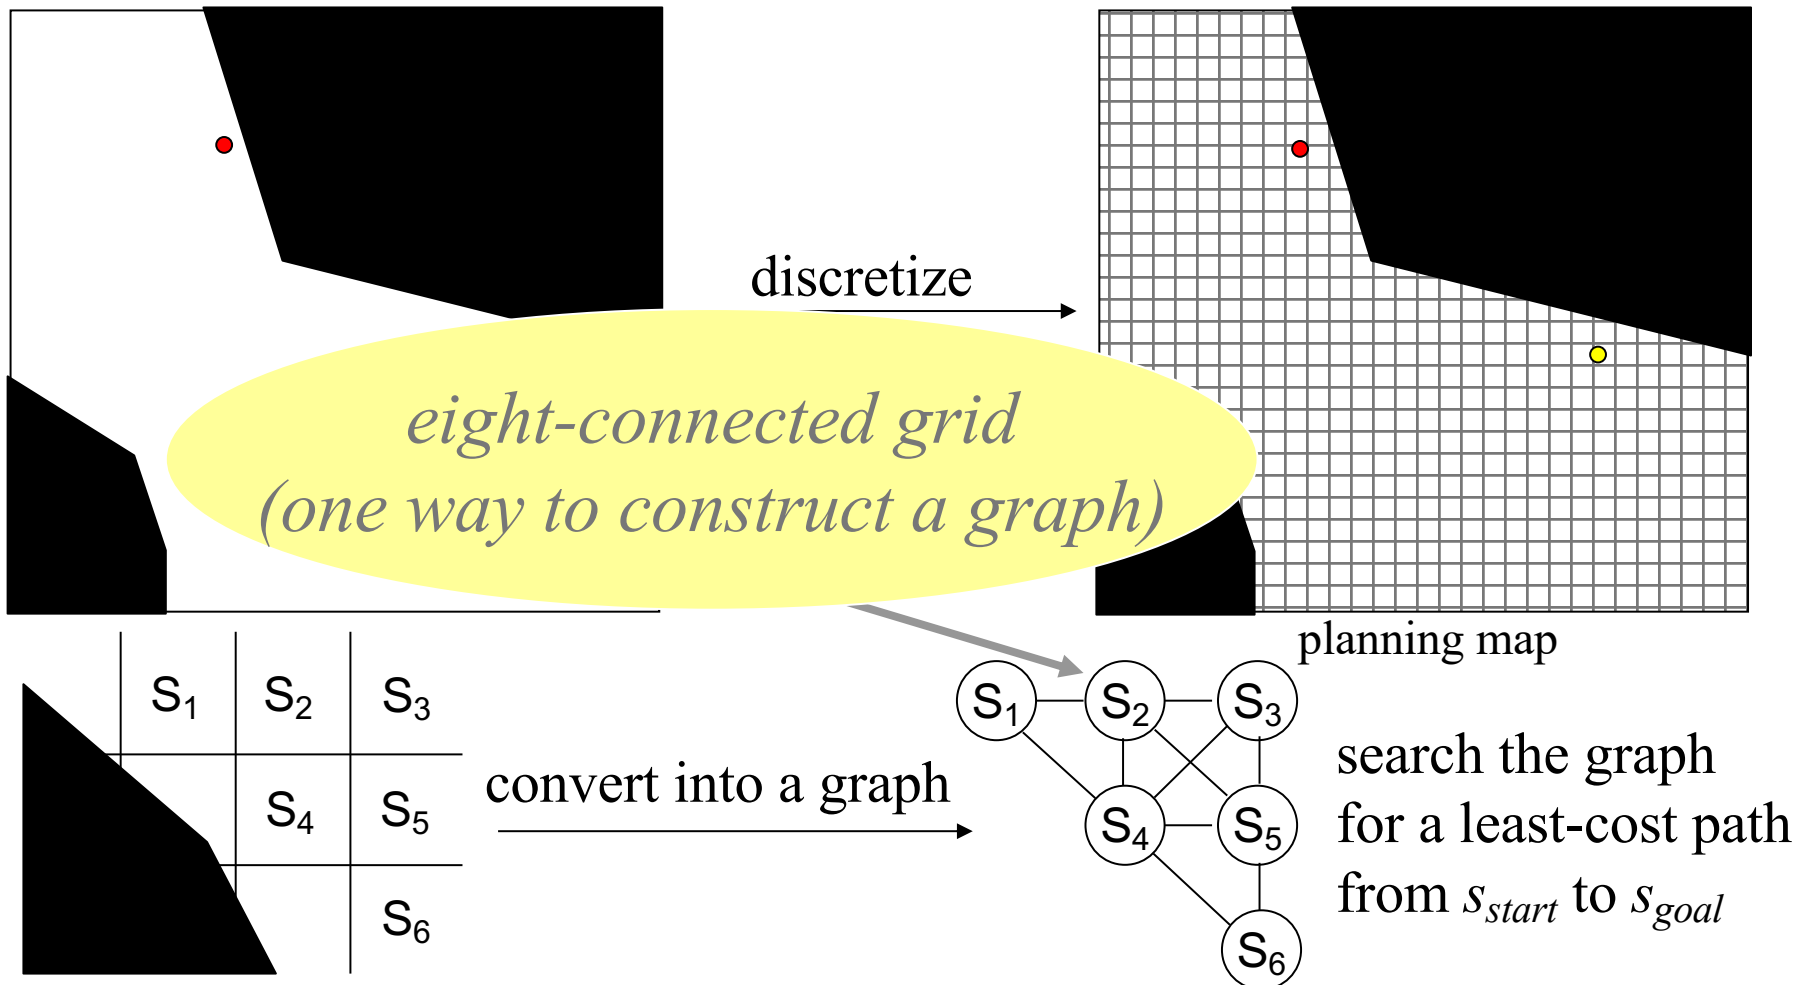

Planning via Cell Decomposition

- Approximate Cell Decomposition:
 - construct a graph and search it for a least-cost path

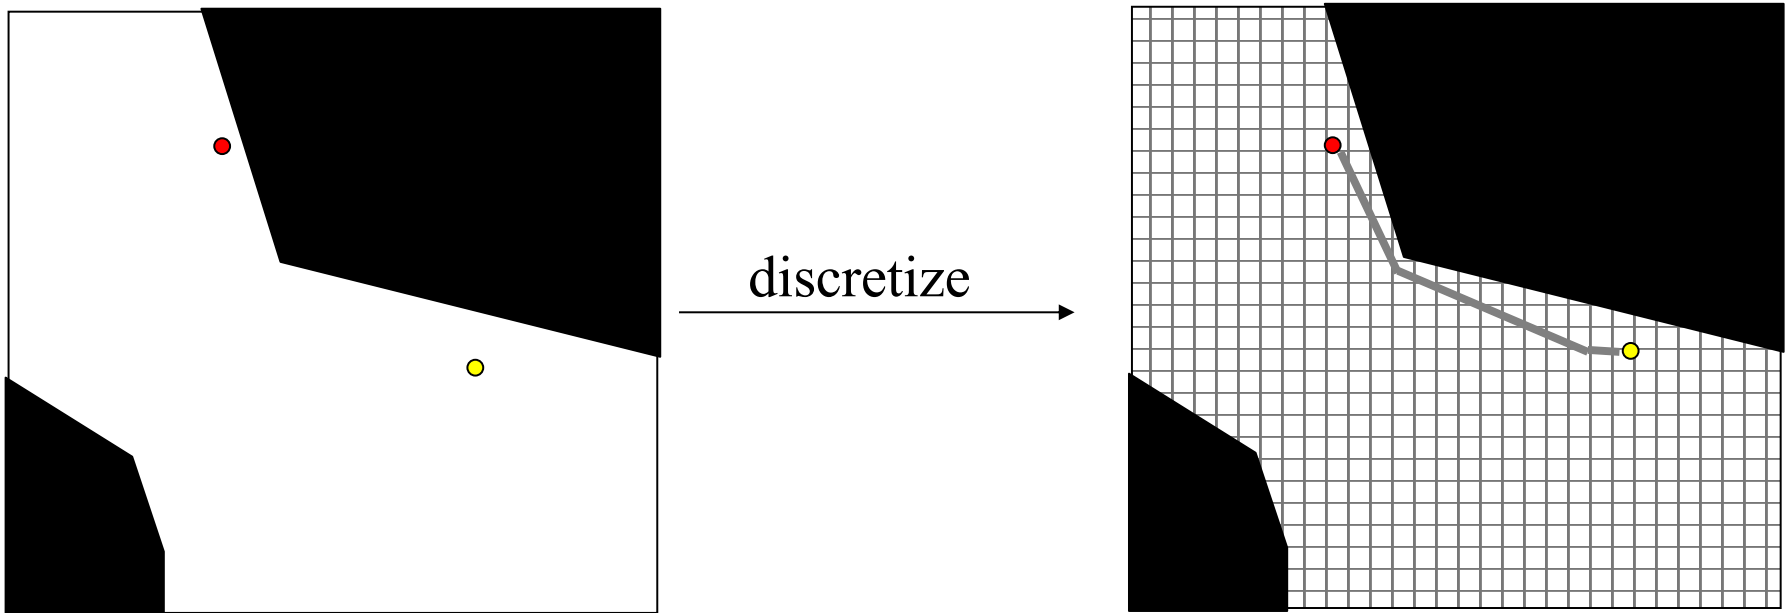

Planning via Cell Decomposition

- Approximate Cell Decomposition:
 - construct a graph and search it for a least-cost path

Planning via Cell Decomposition

- Approximate Cell Decomposition:
 - construct a graph and search it for a least-cost path
 - VERY popular due to its simplicity and representation of arbitrary obstacles
 - Problem: transitions difficult to execute on non-holonomic robots

Planning via Cell Decomposition

- Graph construction:
 - lattice graph

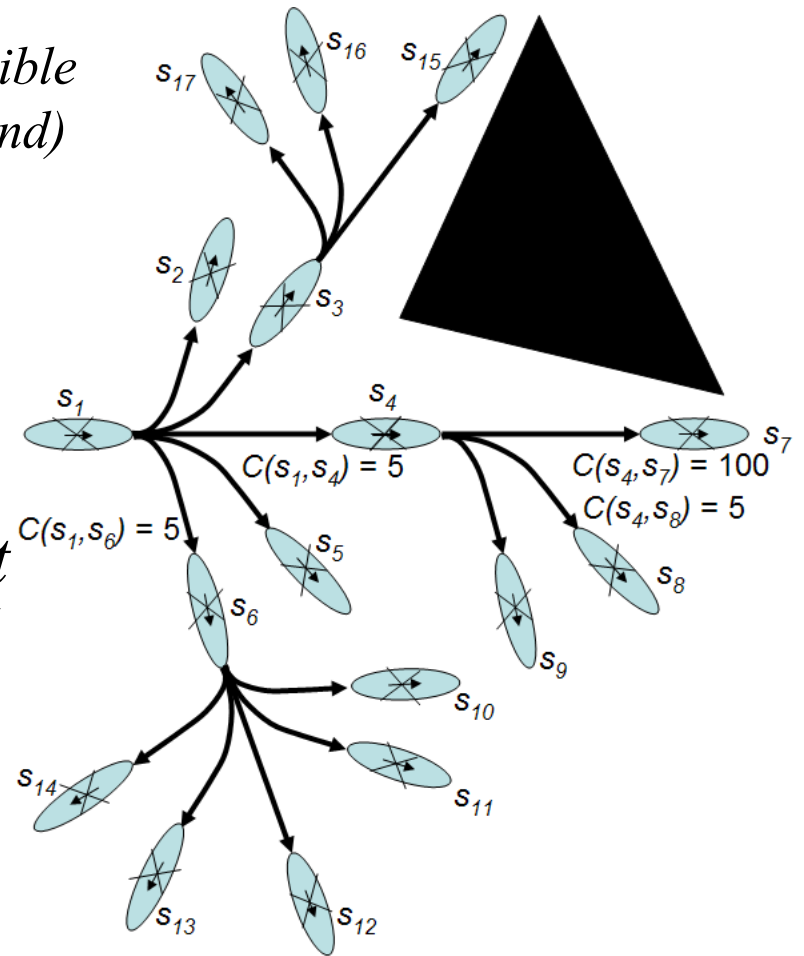

outcome state is the center of the corresponding cell

*each transition is feasible
(constructed beforehand)*

action template

*replicate it
online*

Planning via Cell Decomposition

- Graph construction:
 - lattice graph
 - pros: sparse graph, feasible paths
 - cons: possible incompleteness

action template

*replicate it
online*

Outline

- Deterministic planning
 - constructing a graph
 - search with A^*
 - search with D^*

- Planning under uncertainty
 - Markov Decision Processes (MDP)
 - Partially Observable Decision Processes (POMDP)

A* Search

- Computes optimal g-values for relevant states

at any point of time:

A* Search

- Computes optimal g-values for relevant states

at any point of time:

one popular heuristic function – Euclidean distance

A* Search

- Computes optimal g-values for relevant states

ComputePath function

while(s_{goal} is not expanded)

remove s with the smallest $[f(s) = g(s) + h(s)]$ from *OPEN*;

insert s into *CLOSED*;

for every successor s' of s such that s' not in *CLOSED*

if $g(s') > g(s) + c(s, s')$

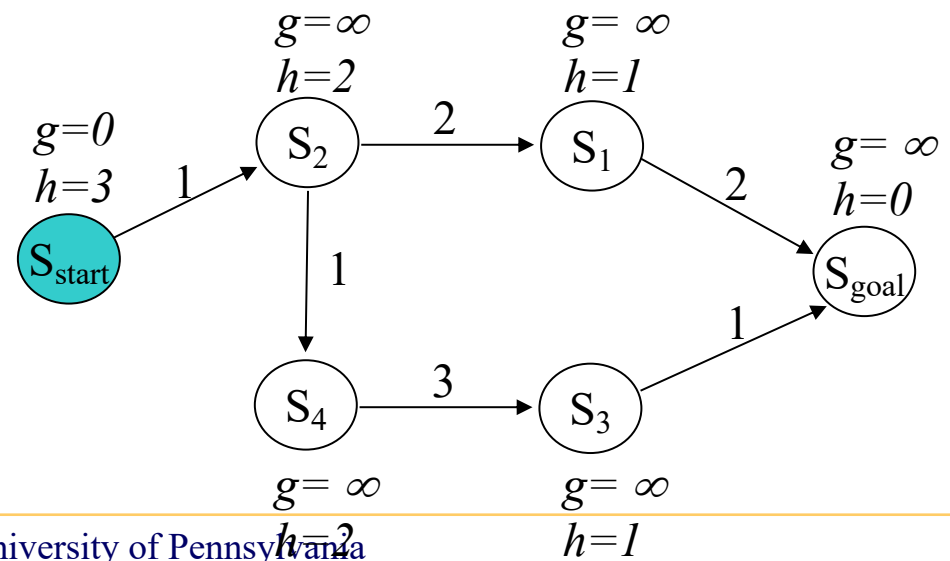

$g(s') = g(s) + c(s, s')$;

insert s' into *OPEN*;

CLOSED = { }

OPEN = { s_{start} }

next state to expand: s_{start}

A* Search

OPEN = $\{s_3\}$

done

A* Search

- Computes optimal g-values for relevant states

ComputePath function

while(s_{goal} is not expanded)

remove s with the smallest $[f(s) = g(s) + h(s)]$ from *OPEN*;

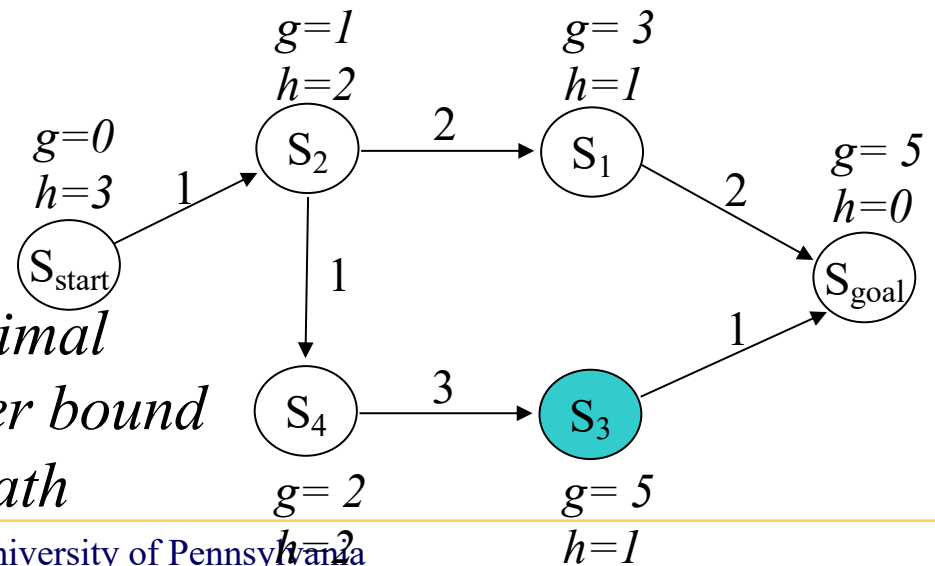

insert s into *CLOSED*;

for every successor s' of s such that s' not in *CLOSED*

if $g(s') > g(s) + c(s, s')$

$g(s') = g(s) + c(s, s')$;

insert s' into *OPEN*;

for every expanded state $g(s)$ is optimal

for every other state $g(s)$ is an upper bound

we can now compute a least-cost path

A* Search

- Computes optimal g-values for relevant states

ComputePath function

while(s_{goal} is not expanded)

remove s with the smallest [$f(s) = g(s) + h(s)$] from *OPEN*;

insert s into *CLOSED*;

for every successor s' of s such that s' not in *CLOSED*

if $g(s') > g(s) + c(s, s')$

$g(s') = g(s) + c(s, s')$;

insert s' into *OPEN*;

for every expanded state $g(s)$ is optimal

for every other state $g(s)$ is an upper bound

we can now compute a least-cost path

A* Search

- Is guaranteed to return an optimal path (in fact, for every expanded state) – optimal in terms of the solution
- Performs provably minimal number of state expansions required to guarantee optimality – optimal in terms of the computations

A* Search

- Is guaranteed to return an optimal path (in fact, for every expanded state) – *helps with robot deviating off its path if we search with A* backwards (from goal to start)*
- Performs provably minimal number of state expansions required to guarantee optimality – optimal in terms of the computations

Effect of the Heuristic Function

- A* Search: expands states in the order of $f = g+h$ values

Effect of the Heuristic Function

- A* Search: expands states in the order of $f = g+h$ values

for large problems this results in A quickly running out of memory (memory: $O(n)$)*

Effect of the Heuristic Function

- Weighted A* Search: expands states in the order of $f = g + \epsilon h$ values, $\epsilon > 1$ = bias towards states that are closer to goal

*solution is always ϵ -suboptimal:
 $cost(solution) \leq \epsilon \cdot cost(optimal\ solution)$*

Adaptive Real-Time A*

$\epsilon = 2.5$

$\epsilon = 1.5$

$\epsilon = 1.0$ (optimal search)

initial search ($\epsilon = 2.5$)

second search ($\epsilon = 1.5$)

third search ($\epsilon = 1.0$)

Effect of the Heuristic Function

- Weighted A* Search: expands states in the order of $f = g + \epsilon h$ values, $\epsilon > 1$ = bias towards states that are closer to goal

20DOF simulated robotic arm
state-space size: over 10^{26} states

planning with ARA* (anytime version of weighted A*)

Effect of the Heuristic Function

- planning in 8D ($\langle x, y \rangle$ for each foothold)
- heuristic is Euclidean distance from the center of the body to the goal location
- cost of edges based on kinematic stability of the robot and quality of footholds

planning with R^* (randomized version of weighted A^*)

joint work with Subhrajit Bhattacharya, Jon Bohren, Sachin Chitta, Daniel D. Lee, Aleksandr Kushleyev, Paul Vernaza

Outline

- Deterministic planning
 - constructing a graph
 - search with A^*
 - search with D^*

Incremental version of A* (D*/D* Lite)

- Robot needs to re-plan whenever
 - new information arrives (partially-known environments or/and dynamic environments)
 - robot deviates off its path

*ATRV navigating
initially-unknown environment*

planning map and path

Incremental version of A* (D*/D* Lite)

- Robot needs to re-plan whenever
 - new information arrives (partially-known environments or/and dynamic environments)
 - robot deviates off its path

*incremental planning (re-planning):
reuse of previous planning efforts*

planning in dynamic environments

Tartanracing, CMU

Motivation for Incremental Version of A*

- Reuse state values from previous searches

cost of least-cost paths to s_{goal} initially

15	14	13	13	13	13		7	6	5	4	4	4	4	4	4	4	4
15	14	14	14	14	14		7	6	5	5	5	5	5	5	5	5	5
15	15	15	15	15	15		7	6	6	6	6	6	6	6	6	6	6
					16		7	7	7	7	7	7	7	7	7	7	7
21	20	19	18	17	17		8	8	8	8	8	8	8	8	8	8	8

Motivation for Incremental Version of A*

- Reuse state values from previous searches

cost of least-cost paths to s_{goal} initially

14	13	12	11	10	9	8	7	6	6	6	6	6	6	6	6	6	6
14	13	12	11	10	9	8	7	6	5	5	5	5	5	5	5	5	5
14	13	12	11	10	9	8	7	6	5	4	4	4	4	4	4	4	4
14	13	12	11	10	9	8	7	6	5	4	3	3	3	3	3	3	3
14	13	12	11	10	9	8	7	6	5	4	3	2	2	2	2	2	3
14	13	12	11	10	9	8	7	6	5	4	3	2	1	1	1	2	3
14	13	12	11	10	9	8	7	6	5	4	3	2	1	1	1	2	3
14	13	12	11	10	9	8	7	6	5	4	3	2	2	2	2	2	3
14	13	12	11	10	9	8	7	6	5	4	3	3	3	3	3	3	3
14	13	12	11	10	10	7	6	5	4	4	4	4	4	4	4	4	4
14	13	12	11	11	11	7	6	5	5	5	5	5	5	5	5	5	5
14	13	12	12	12	12	7	6	5	5	5	5	5	5	5	5	5	5
14	13	12	12	12	12	7	6	5	5	5	5	5	5	5	5	5	5
18	s_{start}	16	15	14	14	7	6	5	5	5	5	5	5	5	5	5	5

Any work needs to be done if robot deviates off its path?

cost of least-cost paths to s_{goal}

14	13	12	11	10	9	8	7	6	6	6	6	6	6	6	6	6	6

Incremental Version of A*

- Reuse state values from previous searches

*initial search by backwards A**

initial search by D Lite*

*second search by backwards A**

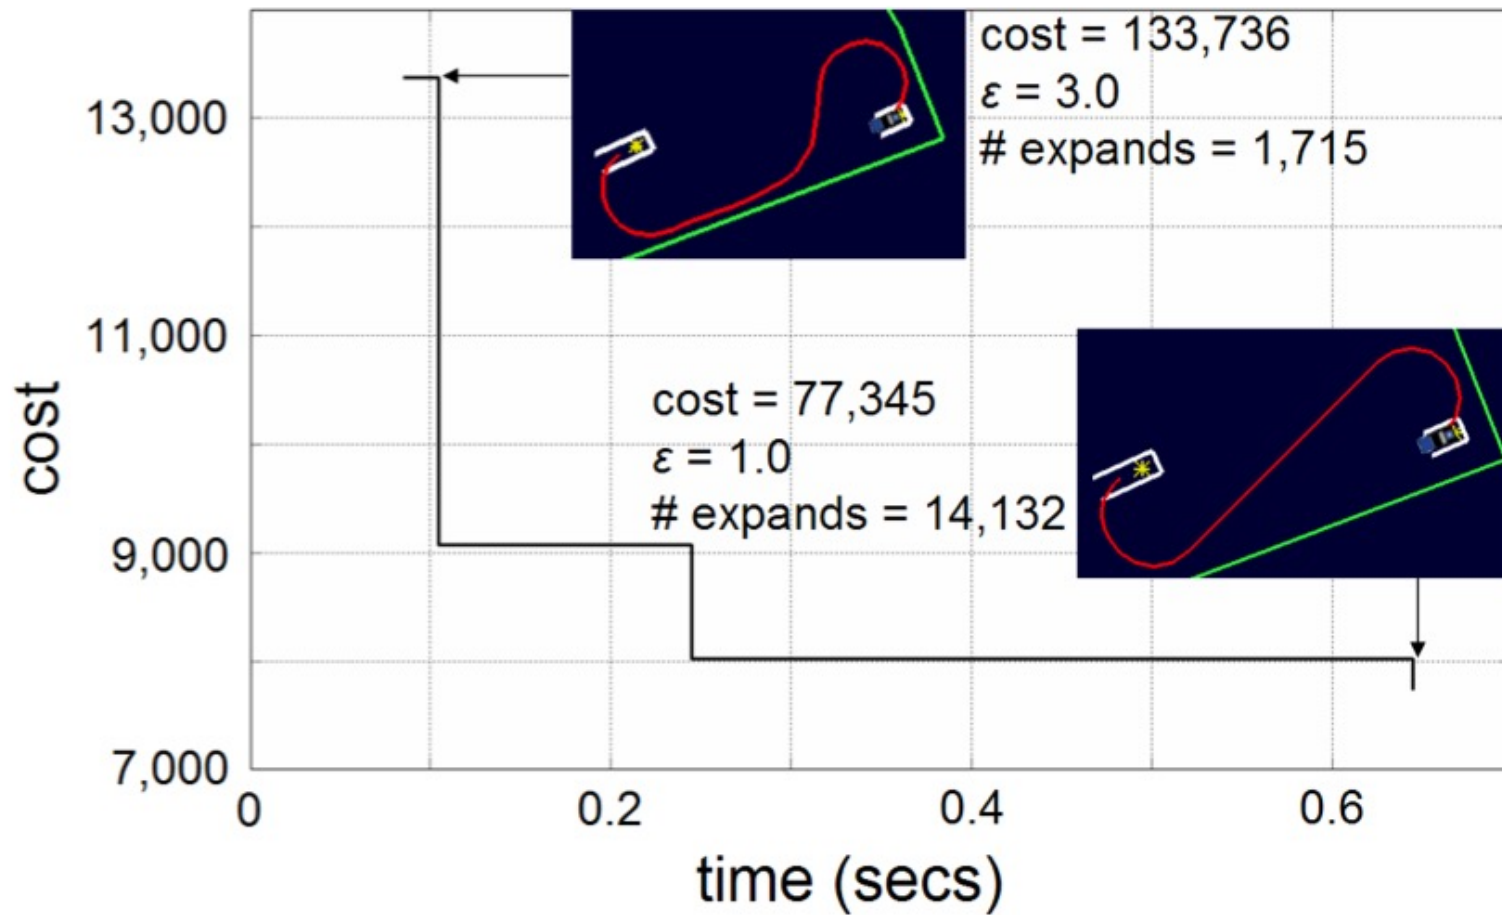

second search by D Lite*

Anytime Aspects

Anytime Aspects

Searching the Graph

- Incremental behavior of Anytime D*:

initial path

a path after re-planning

Searching the Graph

- Performance of Anytime D* depends strongly on heuristics $h(s)$: estimates of cost-to-goal

should be consistent and admissible (never overestimate cost-to-goal)

Searching the Graph

- In our planner: $h(s) = \max(h_{mech}(s), h_{env}(s))$, where
 - $h_{mech}(s)$ – mechanism-constrained heuristic
 - $h_{env}(s)$ – environment-constrained heuristic

$h_{mech}(s)$ – considers only dynamics constraints and ignores environment

$h_{env}(s)$ – considers only environment constraints and ignores dynamics

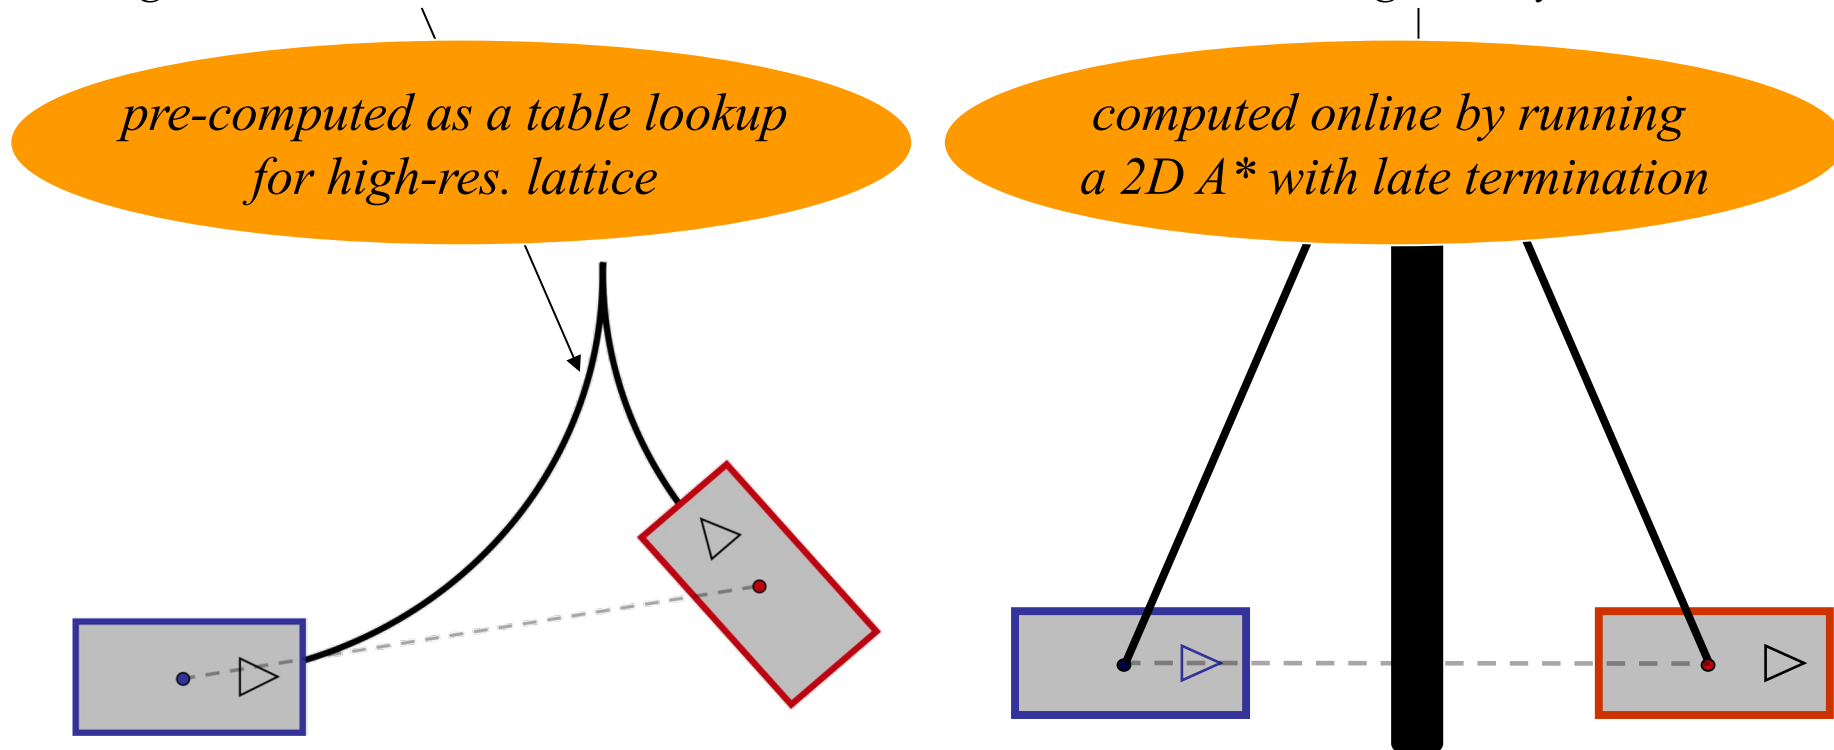

Searching the Graph

- In our planner: $h(s) = \max(h_{mech}(s), h_{env}(s))$, where
 - $h_{mech}(s)$ – mechanism-constrained heuristic
 - $h_{env}(s)$ – environment-constrained heuristic

$h_{mech}(s)$ – considers only dynamics constraints and ignores environment

$h_{env}(s)$ – considers only environment constraints and ignores dynamics

Heuristics

heuristic	states expanded	time (secs)
h	2,019	0.06
h_{2D}	26,108	1.30
h_{fsh}	124,794	3.49

Example, again

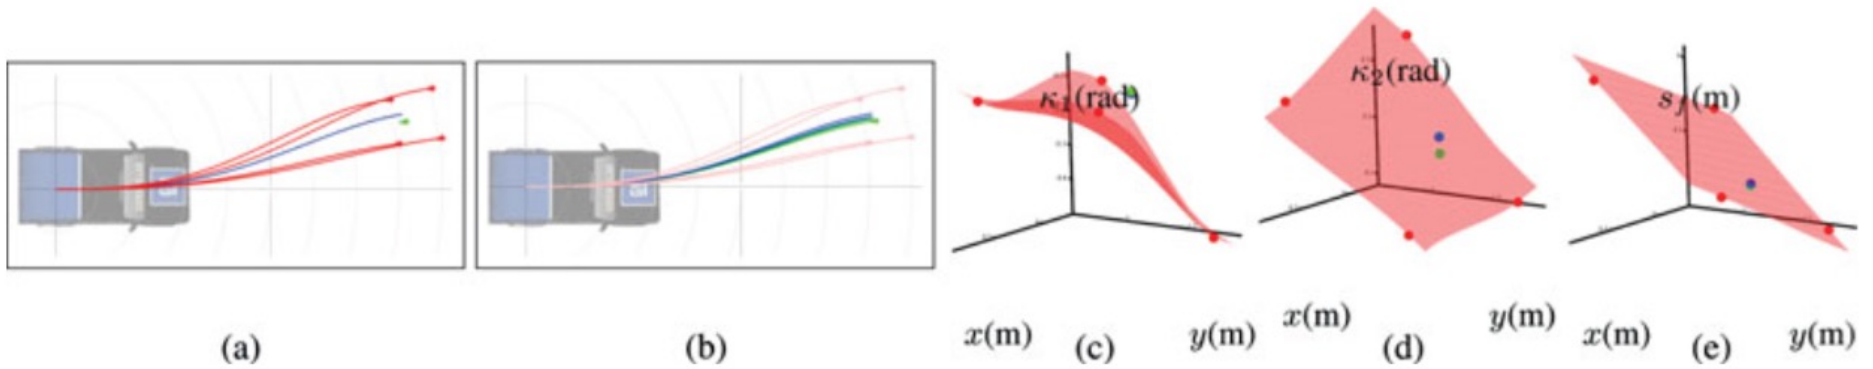

*Urban Challenge Race, CMU team, planning with Anytime D**

Trajectory Pre-Computation and Optimization

Pre-compute parameters for set of end points

Optimize (fine-tune) parameters initialized via interpolation

Predicting and Avoiding Other Vehicles

Passing and Cost

Summary

- Deterministic planning

- constructing a graph
- search with A*
- search with D*

used a lot in real-time

think twice before trying to use it in real-time

- Planning under uncertainty

- Markov Decision Processes (MDP)
- Partially Observable Decision Processes (POMDP)

think three or four times before trying to use it in real-time

Many useful approximate solvers for MDP/POMDP exist!!

Manipulation Planning Examples
