### ***Deterministic Path Planning in Robotics***

*Courtesy of Maxim Likhachev  
Carnegie Mellon University*

1

## Motion/Path Planning

- Task:  
find a feasible (and cost-minimal) path/motion from the current configuration of the robot to its goal configuration (or one of its goal configurations)
- Two types of constraints:  
environmental constraints (e.g., obstacles)  
dynamics/kinematics constraints of the robot
- Generated motion/path should (objective):  
be any feasible path  
minimize cost such as distance, time, energy, risk, ...

CSE-P590a: Courtesy of Maxim Likhachev, CMU

2

## Motion/Path Planning

Examples (of what is usually referred to as path planning):

3

## Motion/Path Planning

Examples (of what is usually referred to as motion planning):

*Piano Movers' problem*

the example above is borrowed from [www.cs.cmu.edu/~cgm/tutorials](http://www.cs.cmu.edu/~cgm/tutorials)

4

## Motion/Path Planning

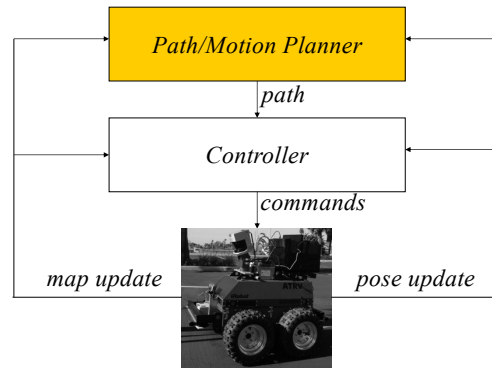

Examples (of what is usually referred to as motion planning):

*Planned motion for a 6DOF robot arm*

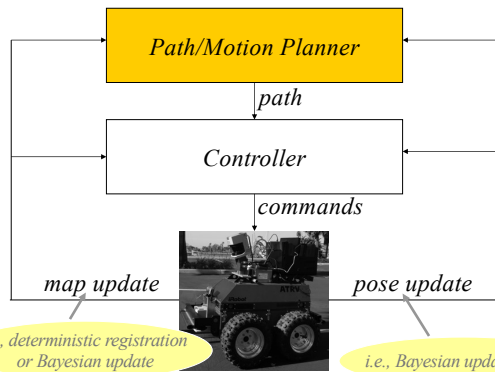

5

## Motion/Path Planning

6

## Motion/Path Planning

7

## Uncertainty and Planning

- Uncertainty can be in:
  - prior environment (i.e., door is open or closed)
  - execution (i.e., robot may slip)
  - sensing environment (i.e., seems like an obstacle but not sure)
  - pose
- Planning approaches:
  - deterministic planning:
    - assume some (i.e., most likely) environment, execution, pose
    - plan a single least-cost trajectory under this assumption
    - re-plan as new information arrives
  - planning under uncertainty:
    - associate probabilities with some elements or everything
    - plan a policy that dictates what to do for each outcome of sensing/action and minimizes expected cost-to-goal
    - re-plan if unaccounted events happen

8

## Uncertainty and Planning

- Uncertainty can be in:
  - prior environment (i.e., door is open or closed)
  - execution (i.e., robot may slip)
  - sensing environment (i.e., seems like an obstacle but not sure)
  - pose
- Planning approaches:
  - deterministic planning:
    - assume some (i.e., most likely) environment, *re-plan every time sensory data arrives or robot deviates off its path*
    - plan a single least-cost trajectory under this assumption
    - re-plan as new information arrives *re-planning needs to be FAST*
  - planning under uncertainty:
    - associate probabilities with some elements or everything
    - plan a policy that dictates what to do for each outcome of sensing/action and minimizes expected cost-to-goal
    - re-plan if unaccounted events happen

9

## Uncertainty and Planning

- Uncertainty can be in:
  - prior environment (i.e., door is open or closed)
  - execution (i.e., robot may slip)
  - sensing environment (i.e., seems like an obstacle but not sure)
  - pose
- Planning approaches:
  - deterministic planning:
    - assume some (i.e., most likely) environment, execution, pose
    - plan a single least-cost trajectory under this assumption
    - re-plan as new information arrives
  - planning under uncertainty:
    - associate probabilities with some elements or everything
    - plan a policy that dictates what to do for each outcome of sensing/action and minimizes expected cost-to-goal *computationally MUCH harder*
    - re-plan if unaccounted events happen

10

## Example

Urban Challenge Race, CMU team, planning with Anytime D\*

11

## Outline

- Deterministic planning
  - constructing a graph
  - search with A\*
  - search with D\*

12

## Outline

  - constructing a graph
  - search with A\*
  - search with D\*

13

## Planning via Cell Decomposition

- Approximate Cell Decomposition:
  - overlay uniform grid over the C-space (discretize)

14

## Planning via Cell Decomposition

- Approximate Cell Decomposition:
  - construct a graph and search it for a least-cost path

15

## Planning via Cell Decomposition

- Approximate Cell Decomposition:
  - construct a graph and search it for a least-cost path

16

### Planning via Cell Decomposition

- Approximate Cell Decomposition:
  - construct a graph and search it for a least-cost path
  - VERY popular due to its simplicity and representation of arbitrary obstacles
  - Problem: transitions difficult to execute on non-holonomic robots

17

### Planning via Cell Decomposition

- Graph construction:
  - lattice graph

outcome state is the center of the corresponding cell

each transition is feasible (constructed beforehand)

action template

replicate it online

18

### Planning via Cell Decomposition

- Graph construction:
  - lattice graph
  - pros: sparse graph, feasible paths
  - cons: possible incompleteness

action template

replicate it online

19

### Outline

- Deterministic planning
  - constructing a graph
  - search with A\*
  - search with D\*
- Planning under uncertainty
  - Markov Decision Processes (MDP)
  - Partially Observable Decision Processes (POMDP)

at any point of time:

22

## A\* Search

- Computes optimal g-values for relevant states

### ComputePath function

```

while( $s_{goal}$  is not expanded)
  remove  $s$  with the smallest  $[f(s) = g(s) + h(s)]$  from OPEN;
  insert  $s$  into CLOSED;
  for every successor  $s'$  of  $s$  such that  $s'$  not in CLOSED
    if  $g(s') > g(s) + c(s, s')$ 
       $g(s') = g(s) + c(s, s')$ ;
      insert  $s'$  into OPEN;
  
```

$CLOSED = \{\}$   
 $OPEN = \{s_{start}\}$   
 next state to expand:  $s_{start}$

23

## A\* Search

- Computes optimal g-values for relevant states

### ComputePath function

```

while( $s_{goal}$  is not expanded)
  remove  $s$  with the smallest  $[f(s) = g(s) + h(s)]$  from OPEN;
  insert  $s$  into CLOSED;
  for every successor  $s'$  of  $s$  such that  $s'$  not in CLOSED
    if  $g(s') > g(s) + c(s, s')$ 
       $g(s') = g(s) + c(s, s')$ ;
      insert  $s'$  into OPEN;
  
```

$CLOSED = \{\}$   
 $OPEN = \{s_{start}\}$   
 next state to expand:  $s_{start}$

24

## A\* Search

- Computes optimal g-values for relevant states

### ComputePath function

```
while( $s_{goal}$  is not expanded)
  remove  $s$  with the smallest  $[f(s) = g(s) + h(s)]$  from  $OPEN$ ;
  insert  $s$  into  $CLOSED$ ;
  for every successor  $s'$  of  $s$  such that  $s'$  not in  $CLOSED$ 
    if  $g(s') > g(s) + c(s, s')$ 
       $g(s') = g(s) + c(s, s')$ ;
      insert  $s'$  into  $OPEN$ ;
```

$CLOSED = \{s_{start}\}$

$OPEN = \{s_2\}$

next state to expand:  $s_2$

25

## A\* Search

- Computes optimal g-values for relevant states

### ComputePath function

```
while( $s_{goal}$  is not expanded)
  remove  $s$  with the smallest  $[f(s) = g(s) + h(s)]$  from  $OPEN$ ;
  insert  $s$  into  $CLOSED$ ;
  for every successor  $s'$  of  $s$  such that  $s'$  not in  $CLOSED$ 
    if  $g(s') > g(s) + c(s, s')$ 
       $g(s') = g(s) + c(s, s')$ ;
      insert  $s'$  into  $OPEN$ ;
```

$CLOSED = \{s_{start}, s_2\}$

$OPEN = \{s_1, s_4\}$

next state to expand:  $s_1$

26

## A\* Search

- Computes optimal g-values for relevant states

### ComputePath function

```
while( $s_{goal}$  is not expanded)
  remove  $s$  with the smallest  $[f(s) = g(s) + h(s)]$  from  $OPEN$ ;
  insert  $s$  into  $CLOSED$ ;
  for every successor  $s'$  of  $s$  such that  $s'$  not in  $CLOSED$ 
    if  $g(s') > g(s) + c(s, s')$ 
       $g(s') = g(s) + c(s, s')$ ;
      insert  $s'$  into  $OPEN$ ;
```

$CLOSED = \{s_{start}, s_2, s_1\}$

$OPEN = \{s_4, s_{goal}\}$

next state to expand:  $s_4$

27

## A\* Search

- Computes optimal g-values for relevant states

### ComputePath function

```
while( $s_{goal}$  is not expanded)
  remove  $s$  with the smallest  $[f(s) = g(s) + h(s)]$  from  $OPEN$ ;
  insert  $s$  into  $CLOSED$ ;
  for every successor  $s'$  of  $s$  such that  $s'$  not in  $CLOSED$ 
    if  $g(s') > g(s) + c(s, s')$ 
       $g(s') = g(s) + c(s, s')$ ;
      insert  $s'$  into  $OPEN$ ;
```

$CLOSED = \{s_{start}, s_2, s_1, s_4\}$

$OPEN = \{s_3, s_{goal}\}$

next state to expand:  $s_{goal}$

28

## A\* Search

- Computes optimal g-values for relevant states

### ComputePath function

```

while( $s_{goal}$  is not expanded)
  remove  $s$  with the smallest  $[f(s) = g(s) + h(s)]$  from  $OPEN$ ;
  insert  $s$  into  $CLOSED$ ;
  for every successor  $s'$  of  $s$  such that  $s'$  not in  $CLOSED$ 
    if  $g(s') > g(s) + c(s, s')$ 
       $g(s') = g(s) + c(s, s')$ ;
      insert  $s'$  into  $OPEN$ ;
  
```

$CLOSED = \{s_{start}, s_2, s_1, s_4, s_{goal}\}$

$OPEN = \{s_3\}$

done

29

## A\* Search

- Computes optimal g-values for relevant states

### ComputePath function

```

while( $s_{goal}$  is not expanded)
  remove  $s$  with the smallest  $[f(s) = g(s) + h(s)]$  from  $OPEN$ ;
  insert  $s$  into  $CLOSED$ ;
  for every successor  $s'$  of  $s$  such that  $s'$  not in  $CLOSED$ 
    if  $g(s') > g(s) + c(s, s')$ 
       $g(s') = g(s) + c(s, s')$ ;
      insert  $s'$  into  $OPEN$ ;
  
```

for every expanded state  $g(s)$  is optimal  
 for every other state  $g(s)$  is an upper bound  
 we can now compute a least-cost path

30

## A\* Search

- Is guaranteed to return an optimal path (in fact, for every expanded state) – optimal in terms of the solution
- Performs provably minimal number of state expansions required to guarantee optimality – optimal in terms of the computations

31

## A\* Search

- Is guaranteed to return an optimal path (in fact, for every expanded state) – optimal in terms of the solution
- Performs provably minimal number of state expansions required to guarantee optimality – optimal in terms of the computations

32

### Effect of the Heuristic Function

- A\* Search: expands states in the order of  $f = g+h$  values

33

### Effect of the Heuristic Function

- A\* Search: expands states in the order of  $f = g+h$  values

*for large problems this results in A\* quickly running out of memory (memory:  $O(n)$ )*

34

### Effect of the Heuristic Function

- Weighted A\* Search: expands states in the order of  $f = g+\epsilon h$  values,  $\epsilon > 1$  = bias towards states that are closer to goal

*solution is always  $\epsilon$ -suboptimal:  
 $cost(solution) \leq \epsilon \cdot cost(optimal\ solution)$*

35

### Effect of the Heuristic Function

- Weighted A\* Search: expands states in the order of  $f = g+\epsilon h$  values,  $\epsilon > 1$  = bias towards states that are closer to goal

20DOF simulated robotic arm  
state-space size: over  $10^{16}$  states

planning with ARA\* (anytime version of weighted A\*)

36

- planning in 8D ( $\langle x, y \rangle$  for each foothold)
- heuristic is Euclidean distance from the center of the body to the goal location
- cost of edges based on kinematic stability of the robot and quality of footholds

planning with  $R^*$  (randomized version of weighted  $A^*$ )

*joint work with Subhrajit Bhattacharya, Jon Bohren, Sachin Chitta, Daniel D. Lee, Aleksandr Kushleyev, Paul Vernaza*

# Outline

- Deterministic planning
  - constructing a graph
  - search with A\*
  - search with D\*

# Incremental version of A\* (D\*/D\* Lite)

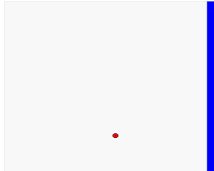

- Robot needs to re-plan whenever
  - new information arrives (partially-known environments or/and dynamic environments)
  - robot deviates off its path

*ATR V navigating initially-unknown environment*

A photograph of a small, red, two-wheeled mobile robot (ATR V) navigating a dark, paved outdoor path. The path is bordered by green bushes and trees on the left and a grassy area with more trees on the right. The scene is brightly lit, suggesting daytime.

*planning map and path*

A diagram illustrating a planning map and path. It features a light gray rectangular area representing the environment. A small red dot is positioned near the bottom center of this area, indicating the robot's current location. To the right of the gray area is a vertical blue bar.

# Motivation for Incremental Version of A\*

- Reuse state values from previous searches  
*cost of least-cost paths to  $s_{goal}$  initially*

45

46

47

48

### Searching the Graph

- Performance of Anytime D\* depends strongly on heuristics  $h(s)$ : estimates of cost-to-goal

*should be consistent and admissible (never overestimate cost-to-goal)*

$S = (x, y, \theta, v)$

$S_{goal}$

$h(s)$

49

49

### Searching the Graph

- In our planner:  $h(s) = \max(h_{mech}(s), h_{env}(s))$ , where
  - $h_{mech}(s)$  – mechanism-constrained heuristic
  - $h_{env}(s)$  – environment-constrained heuristic

*$h_{mech}(s)$  – considers only dynamics constraints and ignores environment*

*$h_{env}(s)$  – considers only environment constraints and ignores dynamics*

50

50

### Searching the Graph

- In our planner:  $h(s) = \max(h_{mech}(s), h_{env}(s))$ , where
  - $h_{mech}(s)$  – mechanism-constrained heuristic
  - $h_{env}(s)$  – environment-constrained heuristic

*$h_{mech}(s)$  – considers only dynamics constraints and ignores environment*

*$h_{env}(s)$  – considers only environment constraints and ignores dynamics*

*pre-computed as a table lookup for high-res. lattice*

*computed online by running a 2D A\* with late termination*

51

51

### Heuristics

heuristic	states expanded	time (secs)
$h$	2,019	0.06
$h_{2D}$	26,108	1.30
$h_{fsh}$	124,794	3.49

52

52

### Example, again

Urban Challenge Race, CMU team, planning with Anytime D\*

53

### Summary

- Deterministic planning
    - constructing a graph *used a lot in real-time*
    - search with A\* *think twice before trying to use it in real-time*
    - search with D\*
  - Planning under uncertainty
    - Markov Decision Processes (MDP)
    - Partially Observable Decision Processes (POMDP) *think three or four times before trying to use it in real-time*
- Many useful approximate solvers for MDP/POMDP exist!!*

54

### Manipulation Planning Examples

55
