

## Perceiving 3D from 2D Images

How can we derive 3D information from one or more 2D images?

There have been 2 approaches:

1. intrinsic images: a 2D representation that stores some 3D properties of the scene
2. 3D shape from X: methods of inferring 3D depth information from various sources

1

What objects are shown in this image?  
How can you estimate distance from the camera?  
What feature changes with distance?

3

What can you determine about

1. the sizes of objects
2. the distances of objects from the camera?

What knowledge do you use to analyze this image?

2

## Intrinsic Images: 2.5 D

The idea of intrinsic images is to label features of a 2D image with information that tells us something about the 3D structure of the scene.

4

## Contour Labels for Intrinsic Images

- convex crease (+)
- concave crease (-)
- blade (>)
- limb (>>)
- shadow (S)
- illumination boundary (I)
- reflectance boundary (M)

5

## Simple Blocks World Constraints for Objects with Trihedral Junctions

There are only 16 topologically possible junctions for this class of images. Huffman/Clowes categorized these.

7

## Labeling Simple Line Drawings

- Huffman and Clowes showed that blocks world drawings could be labeled (with +, -, >) based on real world constraints.
- Labeling a simple blocks world image is a consistent labeling problem!
- Waltz extended the work to cracks and shadows and developed one of the first discrete relaxation algorithms, known as Waltz filtering.

6

## 2 Interpretations

floating

glued to the wall

8

## Line Drawing Labeling

Given a line drawing extracted from an image, find the correct labeling(s).

9

## Problems with this Approach

- Research on how to do these labelings was confined to perfect blocks world images
- There was no way to extend it to real images with missing segments, broken segments, nonconnected junctions, etc.
- It led some groups down the wrong path for a while.

11

## Automatic Labeling

Finding a legal labeling can be done by:

1. tree search with backtracking when a node is inconsistent
2. Waltz filtering or discrete relaxation

Initialize the label set for each line segment to  $\{+, -, >, <\}$

•  
At each iteration, remove inconsistent labels as follows

If  $L$  is a label for edge  $P_i$  and there is another edge  $P_j$  connected to  $P_i$  that has no label consistent with  $L$ , then remove  $L$  from the label set of  $P_i$ .

10

## 3D Shape from X

- |  |                    |
|--|--------------------|
| <ul style="list-style-type: none"><li>• shading</li><li>• silhouette</li><li>• texture</li></ul>   | } mainly research  |
| <ul style="list-style-type: none"><li>• stereo</li><li>• light striping</li><li>• motion</li></ul> | } used in practice |

12

## Perspective Imaging Model: 1D

This is the axis of the real image plane.

O is the center of projection.

This is the axis of the front image plane, which we use.

$$\frac{x_i}{f} = \frac{x_c}{z_c}$$

13

## 3D from Stereo

• 3D point

left image

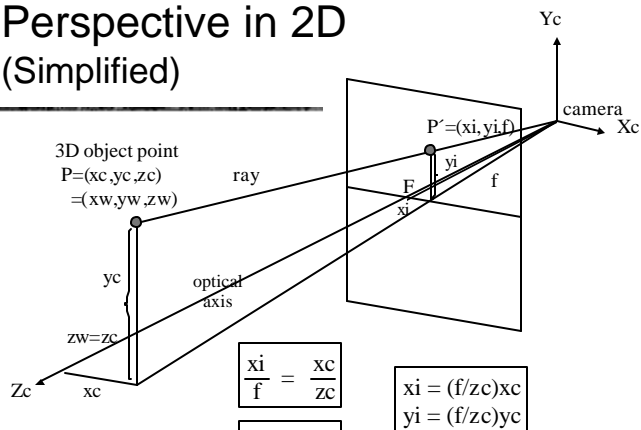

right image

disparity: the difference in image location of the same 3D point when projected under perspective to two different cameras.

$$d = x_{\text{left}} - x_{\text{right}}$$

15

## Perspective in 2D (Simplified)

Here camera coordinates equal world coordinates.

$$\frac{x_i}{f} = \frac{x_c}{z_c}$$

$$\frac{y_i}{f} = \frac{y_c}{z_c}$$

$$x_i = (f/z_c)x_c$$

$$y_i = (f/z_c)y_c$$

14

## Depth Perception from Stereo Simple Model: Parallel Optic Axes

$$\frac{z}{f} = \frac{x}{x_l}$$

$$\frac{z}{f} = \frac{x-b}{x_r}$$

$$\frac{z}{f} = \frac{y}{y_l} = \frac{y}{y_r}$$

y-axis is perpendicular to the page.

16

## Resultant Depth Calculation

For stereo cameras with parallel optical axes, focal length  $f$ , baseline  $b$ , corresponding image points  $(x_l, y_l)$  and  $(x_r, y_r)$  with disparity  $d$ :

$$z = f \cdot b / (x_l - x_r) = f \cdot b / d$$

$$x = x_l \cdot z / f \quad \text{or} \quad b + x_r \cdot z / f$$

$$y = y_l \cdot z / f \quad \text{or} \quad y_r \cdot z / f$$

This method of determining depth from disparity is called **triangulation**.

17

## Finding Correspondences

- If the correspondence is correct, triangulation works **VERY** well.
- But correspondence finding is not perfectly solved for the general stereo problem.
- For some very specific applications, it can be solved for those specific kind of images, e.g. windshield of a car.

18

## 2 Main Matching Methods

1. Cross correlation using small windows.

2. Symbolic feature matching, usually using segments/corners.

19

## Epipolar Geometry Constraint: 1. Normal Pair of Images

The epipolar plane cuts through the image plane(s) forming 2 epipolar lines.

The match for  $P_1$  (or  $P_2$ ) in the other image, must lie on the same epipolar line.

20

## Epipolar Geometry: General Case

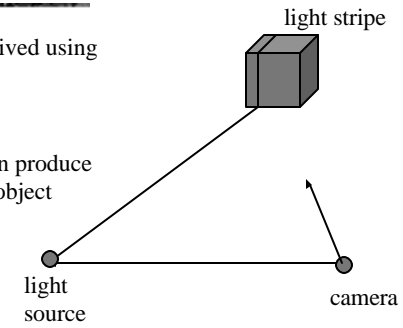

21

## Structured Light

3D data can also be derived using

- a single camera
- a light source that can produce stripe(s) on the 3D object

23

## Constraints

1. Epipolar Constraint:  
Matching points lie on corresponding epipolar lines.
2. Ordering Constraint:  
Usually in the same order across the lines.

22

## Structured Light 3D Computation

3D data can also be derived using

- a single camera
- a light source that can produce stripe(s) on the 3D object

$$\begin{bmatrix} x & y & z \\ \text{3D} \end{bmatrix} = \frac{b}{f \cot \theta - x'} \begin{bmatrix} x' & y' & f \\ \text{image} \end{bmatrix}$$

24

## Depth from Multiple Light Stripes
