

Texture

Texture is a description of the spatial arrangement of color or intensities in an image or a selected region of an image.

Structural approach: a set of **texels** in some regular or repeated pattern

MIT VisTex mosaic Tile 0607

Simulation of the text-based prototype

MIT Project to find the Texels

Estimation of the text:

- Ordering gray-level co-occurrence histograms and fitting the text-based prototype map (MDD) of Gabor images for shape features in the search window (SWS), the response $R = 0.12$
- Ordering spatial energy clusters (by thresholding the MDD) and computing the correlation and size of the rectangular text by using clusters with the largest and the second largest maximum energy
- Using the training sample as a seed with the estimated parameters of the prototype

Regular mosaic: MIT VisTex Tile 0607

Training sample MDD Energy clusters Estimated tiling

Number of quadrants: 640 x 640

Problem with Structural Approach

How do you decide what is a texel?

Ideas?

MIT VisTex mosaic Fabric 0008

What/Where are the texels?

5

Some Simple Statistical Texture Measures

1. Edge Density and Direction

- Use an **edge detector** as the first step in texture analysis.
- The **number of edge pixels** in a fixed-size region tells us how busy that region is.
- The **directions of the edges** also help characterize the texture

7

The Case for Statistical Texture

- Segmenting out texels is difficult or impossible in real images.
- Numeric quantities or statistics that describe a texture can be computed from the gray tones (or colors) alone.
- This approach is less intuitive, but is computationally efficient.
- It can be used for both classification and segmentation.

6

Two Edge-based Texture Measures

1. edgeness per unit area

$$F_{\text{edgeness}} = \frac{|\{ p \mid \text{gradient_magnitude}(p) \geq \text{threshold} \}|}{N}$$

where N is the size of the unit area

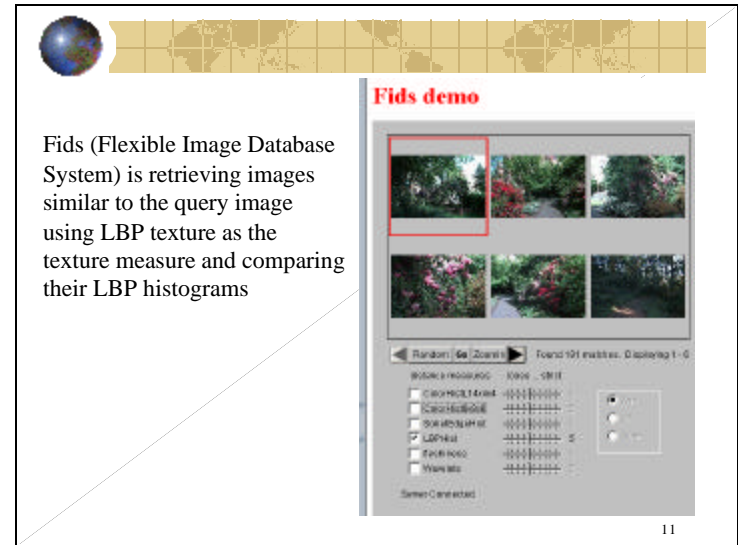

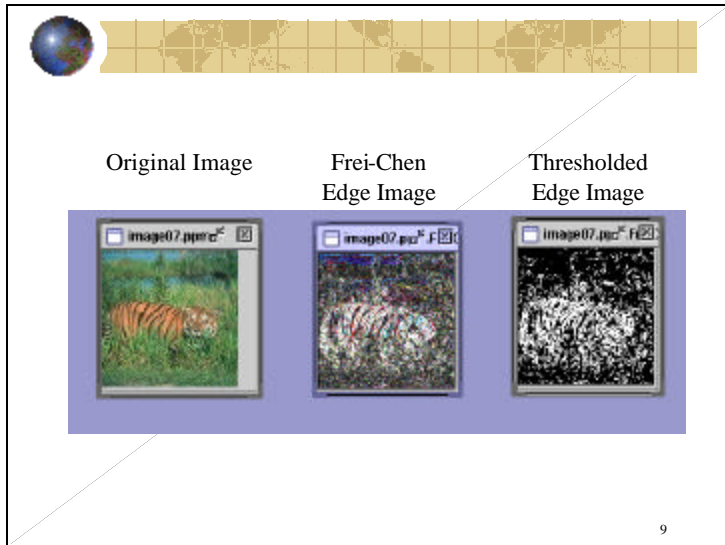

2. edge magnitude and direction histograms

$$F_{\text{magdir}} = (H_{\text{magnitude}}, H_{\text{direction}})$$

where these are the normalized histograms of gradient magnitudes and gradient directions, respectively.

How would you compare two histograms?

8

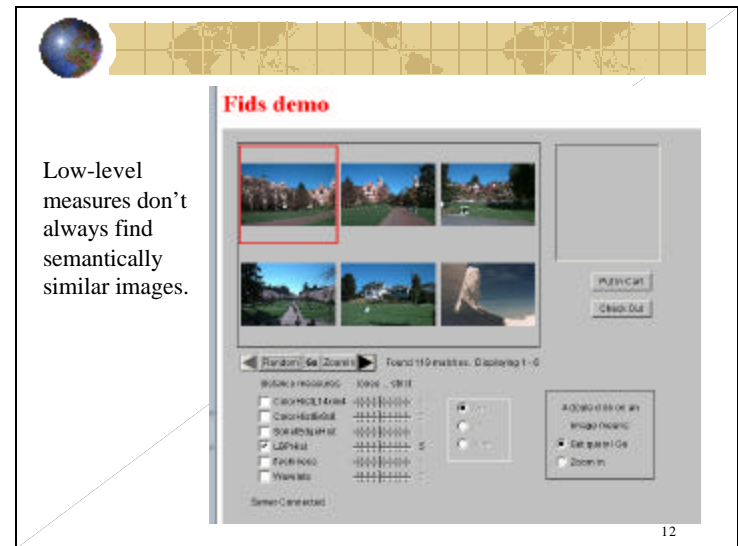

Local Binary Partition Measure

- For each pixel p , create an 8-bit number $b_1 b_2 b_3 b_4 b_5 b_6 b_7 b_8$, where $b_i = 0$ if neighbor i has value less than or equal to p 's value and 1 otherwise.
- Represent the texture in the image (or a region) by the histogram of these numbers.

Co-occurrence Matrix Features

A co-occurrence matrix is a 2D array C in which

- Both the rows and columns represent a set of possible image values
- $C_d(i,j)$ indicates how many times value i co-occurs with value j in a particular spatial relationship d .
- The spatial relationship is specified by a vector $d = (dr,dc)$.

13

Co-occurrence Features

What do these measure?

$$Energy = \sum_i \sum_j N_d^2(i,j) \quad (7.7)$$

$$Entropy = - \sum_i \sum_j N_d(i,j) \log_2 N_d(i,j) \quad (7.8)$$

$$Contrast = \sum_i \sum_j (i-j)^2 N_d(i,j) \quad (7.9)$$

$$Homogeneity = \sum_i \sum_j \frac{N_d(i,j)}{1+|i-j|} \quad (7.10)$$

$$Correlation = \frac{\sum_i \sum_j (i-\mu_i)(j-\mu_j) N_d(i,j)}{\sigma_i \sigma_j} \quad (7.11)$$

where μ_i, μ_j are the means and σ_i, σ_j are the standard deviations of the row and column sums.

Energy measures uniformity of the normalized matrix.

15

gray-tone image

co-occurrence matrix

From C_d we can compute N_d , the normalized co-occurrence matrix, where each value is divided by the sum of all the values.

14

But how do you choose d ?

- This is actually a critical question with **all** the statistical texture methods.
- Are the “texels” tiny, medium, large, all three ...?
- Not really a solved problem.

Zucker and Terzopoulos suggested using a χ^2 statistical test to select the value(s) of d that have the most structure for a given class of images. See transparencies.

16

Laws' Texture Energy Features

- Signal-processing-based algorithms use texture filters applied to the image to create filtered images from which texture features are computed.
- The Laws Algorithm
 - **Filter** the input image using texture filters.
 - **Compute texture energy** by summing the absolute value of filtering results in local neighborhoods around each pixel.
 - **Combine features** to achieve rotational invariance.

17

Law's texture masks (2)

Creation of 2D Masks

- **1D Masks** are "multiplied" to construct **2D masks**:
mask E5L5 is the "product" of E5 and L5 -

$$E5 \begin{bmatrix} -1 \\ -2 \\ 0 \\ 2 \\ 1 \end{bmatrix} \times \begin{matrix} L5 \\ [1 \ 4 \ 6 \ 4 \ 1] \end{matrix} = \begin{bmatrix} -1 & -4 & -6 & -4 & -1 \\ -2 & -8 & -12 & -8 & -1 \\ 0 & 0 & 0 & 0 & 0 \\ 2 & 8 & 12 & 8 & 2 \\ 1 & 4 & 6 & 4 & 1 \end{bmatrix} E5L5$$

Law's texture masks (1)

$$\begin{array}{lll} L5 \text{ (Level)} & = & [\ 1 \ 4 \ 6 \ 4 \ 1 \] \\ E5 \text{ (Edge)} & = & [-1 \ -2 \ 0 \ 2 \ 1 \] \\ S5 \text{ (Spot)} & = & [-1 \ 0 \ 2 \ 0 \ -1 \] \\ R5 \text{ (Ripple)} & = & [\ 1 \ -4 \ 6 \ -4 \ 1 \] \end{array}$$

- (L5) (Gaussian) gives a center-weighted local average
- (E5) (gradient) responds to row or col step edges
- (S5) (LOG) detects spots
- (R5) (Gabor) detects ripples

18

9D feature vector for pixel

- Subtract mean neighborhood intensity from pixel
- Dot product 16 5x5 masks with neighborhood
- 9 features defined as follows:

$$\begin{array}{ll} L5E5/E5L5 & L5S5/S5L5 \\ L5R5/R5L5 & E5E5 \\ E5S5/S5E5 & E5R5/R5E5 \\ S5S5 & S5R5/R5S5 \\ R5R5 & \end{array}$$

Features from sample images

Table 7.2: Laws texture energy measures for major regions of the images of Figure 7.8.

Region	E0E6	S6S6	R6R6	E0L6	S6L6	R6L6	S6E6	R6E6	R6S6
Tiger	168.1	84.0	807.7	553.7	354.4	910.6	116.3	339.2	257.4
Water	65.5	36.9	306.8	218.7	149.3	459.4	49.6	159.1	117.3
Flags	255.1	113.0	787.7	1057.6	702.2	2050.3	182.4	611.5	350.8
Fence	189.5	80.7	624.3	791.7	377.5	803.1	120.6	287.5	215.0
Grass	205.5	103.6	1031.7	625.2	425.3	1153.6	146.0	427.5	323.6
Small flowers	114.9	49.6	289.1	402.6	241.3	484.3	73.6	158.2	108.3
Big flowers	78.7	28.2	177.1	301.5	155.4	270.0	45.6	89.7	62.9
Borderless	15.3	6.4	64.4	92.3	36.3	74.5	9.3	26.1	19.5

21

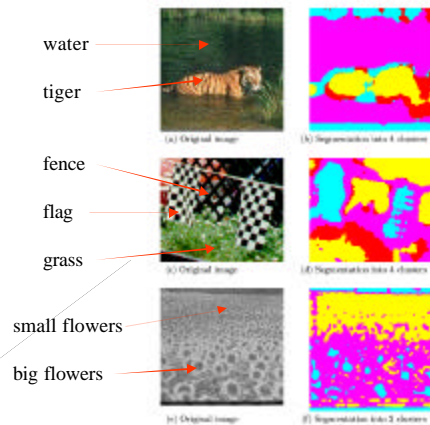

Autocorrelation function

- Autocorrelation function can detect repetitive patterns of texels
- Also defines fineness/coarseness of the texture
- Compare the dot product (energy) of non shifted image with a shifted image

$$\rho(dr, dc) = \frac{\sum_{r=0}^N \sum_{c=0}^N f(r,c)f(r+dr,c+dc)}{\sum_{r=0}^N \sum_{c=0}^N f^2(r,c)}$$

$$= \frac{f(r,c) \circ f_d[r,c]}{f(r,c) \circ f(r,c)}$$

23

Is there a neighborhood size problem with Laws?

22

Interpreting autocorrelation

- Coarse texture → function drops off slowly
- Fine texture → function drops off rapidly
- Can drop differently for r and c
- Regular textures → function will have peaks and valleys; peaks can repeat far away from [0, 0]
- Random textures → only peak at [0, 0]; breadth of peak gives the size of the texture

24

Fourier power spectrum

- High frequency power → fine texture
- Concentrated power → regularity
- Directionality → directional texture

25

What else?

- Gabor filters
- Wold decomposition
- Global Signatures (CANDID)
- Second Moment Matrix (Belongie paper)
- DOOG filter

etc.
