## Multi-view Stereo

Input: calibrated images from several viewpoints  
 Output: 3D object model

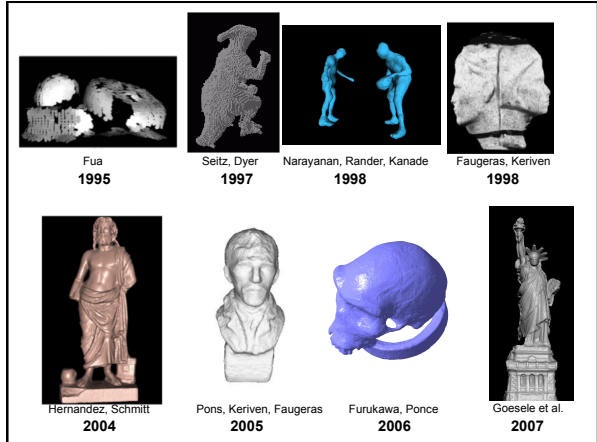

Figure by Carlos Hernandez

## Stereo: basic idea

## Choosing the stereo baseline

What's the optimal baseline?

- Too small: large depth error
- Too large: difficult search problem

## The Effect of Baseline on Depth Estimation

pixel matching score

Fig. 5. SSD values versus inverse distance: (a)  $B = b$ , (b)  $B = 2b$ , (c)  $B = 3b$ , (d)  $B = 4b$ , (e)  $B = 5b$ , (f)  $B = 6b$ , (g)  $B = 7b$ , (h)  $B = 8b$ , (i)  $B = 9b$ . The horizontal axis is normalized such that  $bB = 1$ .

Fig. 6. Combining two stereo pairs with different baselines.

Fig. 7. Combining multiple baseline stereo pairs.

## Multibaseline Stereo

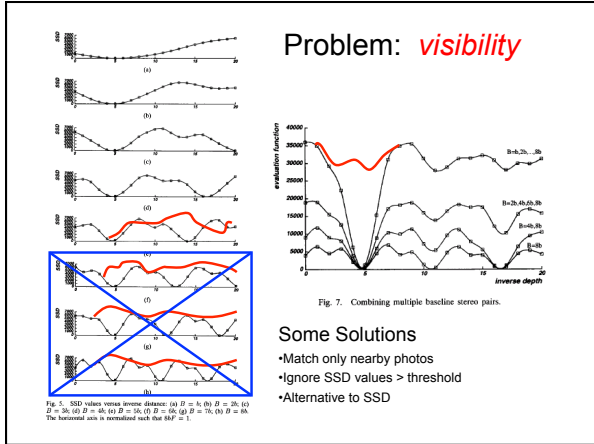

### Basic Approach

- Choose a reference view
- Use your favorite stereo algorithm BUT
  - > replace two-view SSD with SSSD over all baselines

### Limitations

- Only gives a depth map (not an "object model")
- Won't work for widely distributed views:

### Popular matching scores

- SSD (Sum Squared Distance)
 
$$\sum_{x,y} |W_1(x,y) - W_2(x,y)|^2$$
- NCC (Normalized Cross Correlation)
 
$$\frac{\sum_{x,y} (W_1(x,y) - \bar{W}_1)(W_2(x,y) - \bar{W}_2)}{\sigma_{W_1} \sigma_{W_2}}$$
  - where  $\bar{W}_i = \frac{1}{n} \sum_{x,y} W_i$      $\sigma_{W_i} = \sqrt{\frac{1}{n} \sum_{x,y} (W_i - \bar{W}_i)^2}$
  - what advantages might NCC have?

### Merging Depth Maps

vrip [Curless and Levoy 1996]

- compute weighted average of depth maps

set of depth maps (one per view) → merged surface mesh

### Merging depth maps

Naïve combination (union) produces artifacts

Better solution: find "average" surface

- Surface that minimizes sum (of squared) distances to the depth maps

### Least squares solution

$$E(f) = \sum_{i=1}^N \int d_i^2(x, f) dx$$

### VRIP [Curless & Levoy 1996]

### Merging Depth Maps: Temple Model

input image

317 images  
(hemisphere)

ground truth model
