# Simple Normalized Descriptor

interest point

201

neighborhood around  
interest point

45	56	200
46	201	200
85	101	105

normalized neighborhood  
around interest point

156	145	1
155	0	1
116	100	96

- The simple descriptor just subtracts the center value from each of the neighbors, including itself to normalize for lighting and exposure.
- We can store this as a 1D vector to be efficient:  
**156 145 1 155 0 1 116 100 96**

# Properties of our Descriptor

- Translation Invariant
  - Not scale invariant
  - Not rotation invariant
  - Somewhat invariant to lighting changes
- 
- Let's look at the SIFT descriptor, because it is heavily used, even without using the SIFT key point detector.
  - It already solves the scale problem by computing at multiple scales and keeping track.

# Rotation invariance

- Rotate patch according to its **dominant gradient orientation**
- This puts the patches into a canonical orientation.

# Orientation Normalization

- Compute orientation histogram
- Select dominant orientation
- Normalize: rotate to fixed orientation

[Lowe, SIFT, 1999]

Once we have found the key points and a dominant orientation for each, we need to **describe** the (**rotated and scaled**) neighborhood about each.

# SIFT descriptor

## Full version

- Divide the 16x16 window into a 4x4 grid of cells (2x2 case shown below)
- Compute an **orientation histogram** for each cell
- 16 cells \* 8 orientations = 128 dimensional descriptor

# SIFT descriptor

## Full version

- Divide the **16x16 window** into a 4x4 grid of cells
- Compute an **orientation histogram** for each cell
- 16 cells \* 8 orientations = **128 dimensional descriptor**

# Matching with Features

- Detect feature points in both images

# Matching with Features

- Detect feature points in both images
- Find corresponding pairs

# Find the best matches

- For each descriptor  $a$  in  $A$ , find its best match  $b$  in  $B$

- And store it in a vector of matches
- Note: this is abstract; see code for details.

- Larger Goal: Combine two or more overlapping images to make one larger image

# Simple case: translations

Displacement of match  $i = (\mathbf{x}'_i - \mathbf{x}_i, \mathbf{y}'_i - \mathbf{y}_i)$

$$(\mathbf{x}_t, \mathbf{y}_t) = \left( \frac{1}{n} \sum_{i=1}^n \mathbf{x}'_i - \mathbf{x}_i, \frac{1}{n} \sum_{i=1}^n \mathbf{y}'_i - \mathbf{y}_i \right)$$

# Solving for homographies

$$\begin{bmatrix} x'_i \\ y'_i \\ 1 \end{bmatrix} \cong \begin{bmatrix} h_{00} & h_{01} & h_{02} \\ h_{10} & h_{11} & h_{12} \\ h_{20} & h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix}$$

Why is this now a variable and not just 1?

- A homography is a projective object, in that it has no scale. It is represented by the above matrix, up to scale.
- One way of fixing the scale is to set one of the coordinates to 1, though that choice is arbitrary.
- But that's what most people do and your assignment code does.

# Solving for homographies

$$\begin{bmatrix} x'_i \\ y'_i \\ 1 \end{bmatrix} \cong \begin{bmatrix} h_{00} & h_{01} & h_{02} \\ h_{10} & h_{11} & h_{12} \\ h_{20} & h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix}$$

$$x'_i = \frac{h_{00}x_i + h_{01}y_i + h_{02}}{h_{20}x_i + h_{21}y_i + h_{22}}$$

$$y'_i = \frac{h_{10}x_i + h_{11}y_i + h_{12}}{h_{20}x_i + h_{21}y_i + h_{22}}$$

Why the division?

$$x'_i(h_{20}x_i + h_{21}y_i + h_{22}) = h_{00}x_i + h_{01}y_i + h_{02}$$

$$y'_i(h_{20}x_i + h_{21}y_i + h_{22}) = h_{10}x_i + h_{11}y_i + h_{12}$$

# Solving for homographies

$$x'_i(h_{20}x_i + h_{21}y_i + h_{22}) = h_{00}x_i + h_{01}y_i + h_{02}$$

$$y'_i(h_{20}x_i + h_{21}y_i + h_{22}) = h_{10}x_i + h_{11}y_i + h_{12}$$

$$\begin{bmatrix} x_i & y_i & 1 & 0 & 0 & 0 & -x'_i x_i & -x'_i y_i & -x'_i \\ 0 & 0 & 0 & x_i & y_i & 1 & -y'_i x_i & -y'_i y_i & -y'_i \end{bmatrix} \begin{bmatrix} h_{00} \\ h_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

This is just for one pair of points.

# Direct Linear Transforms (n points)

$$\begin{bmatrix}
 x_1 & y_1 & 1 & 0 & 0 & 0 & -x'_1 x_1 & -x'_1 y_1 & -x'_1 \\
 0 & 0 & 0 & x_1 & y_1 & 1 & -y'_1 x_1 & -y'_1 y_1 & -y'_1 \\
 & & & & & \vdots & & & \\
 x_n & y_n & 1 & 0 & 0 & 0 & -x'_n x_n & -x'_n y_n & -x'_n \\
 0 & 0 & 0 & x_n & y_n & 1 & -y'_n x_n & -y'_n y_n & -y'_n
 \end{bmatrix}
 \begin{bmatrix}
 h_{00} \\
 h_{01} \\
 h_{02} \\
 h_{10} \\
 h_{11} \\
 h_{12} \\
 h_{20} \\
 h_{21} \\
 h_{22}
 \end{bmatrix}
 =
 \begin{bmatrix}
 0 \\
 0 \\
 \vdots \\
 0 \\
 0
 \end{bmatrix}$$

$\mathbf{A}$   
 $2n \times 9$

$\mathbf{h}$   
 $9$

$\mathbf{0}$   
 $2n$

Defines a least squares problem:

$$\text{minimize } \|\mathbf{A}\mathbf{h} - \mathbf{0}\|^2$$

- Since  $\mathbf{h}$  is only defined up to scale, solve for unit vector  $\hat{\mathbf{h}}$
- **Solution:  $\hat{\mathbf{h}}$  = eigenvector of  $\mathbf{A}^T \mathbf{A}$  with smallest eigenvalue**
- Works with 4 or more points

# Direct Linear Transforms

- Why could we not solve for the homography in exactly the same way we did for the affine transform, ie.

$$\mathbf{t} = \left( \mathbf{A}^T \mathbf{A} \right)^{-1} \mathbf{A}^T \mathbf{b}$$

# Answer from Sameer Agarwal

## (Dr. Rome in a Day)

- For an **affine transform**, we have equations of the form  $Ax_i + b = y_i$ , solvable by linear regression.
- For the **homography**, the equation is of the form  $H\tilde{x}_i \sim \tilde{y}_i$  (homogeneous coordinates)

and the  $\sim$  means it holds only up to scale. The affine solution does not hold.

Colosseum: 2,097 images, 819,242 points

Trevi Fountain: 1,935 images, 1,055,153 points

# Matching features

# RANSAC for estimating homography

- RANSAC loop:

1. Select four feature pairs (at random)

2. Compute homography  $\mathbf{H}$  (exact)

3. Compute inliers where  $\|p_i', \mathbf{H} p_i\| < \varepsilon$

- Keep largest set of inliers

- Re-compute least-squares  $\mathbf{H}$  estimate using all of the inliers

---

# Panorama algorithm:

Find corners in both images

Calculate descriptors

Match descriptors

RANSAC to find homography

Stitch together images with homography

# Stitching panoramas:

- We know homography is right choice under certain assumption:
  - Assume we are taking multiple images of planar object

homography  $H$

How do we fix it? Cylinders!

# How do we fix it? Cylinders!

Calculate angle and height:

$$\theta = (x - x_c) / f$$

$$h = (y - y_c) / f$$

Find unit cylindrical coords:

$$X' = \sin(\theta)$$

$$Y' = h$$

$$Z' = \cos(\theta)$$

Project to image plane:

$$x' = f X' / Z' + x_c$$

$$y' = f Y' / Z' + y_c$$

$(x_c, y_c)$  = center of projection and  $f$  = focal length of camera

---

# Dependant on focal length!

# Where are we?

- We are going to build a panorama from two (or more) images.
- We need to learn about
  - Finding interest points
  - Describing small patches about such points
  - Finding matches between pairs of such points on two images, using the descriptors
  - Selecting the best set of matches and saving them
  - Constructing homographies (transformations) from one image to the other and picking the best one
  - **Stitching the images together to make the panorama**

# RANSAC for Homography

Initial Matched Points

# RANSAC for Homography

Final Matched Points

# RANSAC for Homography

# Image Blending

What's wrong?

# Feathering

# Effect of window (ramp-width) size

# Effect of window size

# Good window size

What can we do  
instead?

“Optimal” window: smooth but not ghosted

- Doesn't always work...

# Pyramid blending

apple

orange

(d)

(h)

(l)

Create a Laplacian pyramid, blend each level

- Burt, P. J. and Adelson, E. H., A Multiresolution Spline with Application to Image Mosaics, ACM Transactions on Graphics, 42(4), October 1983, 217-236. [http://persci.mit.edu/pub\\_pdfs/spline83.pdf](http://persci.mit.edu/pub_pdfs/spline83.pdf)

# Alpha Blending

Optional: see Blinn (CGA, 1994) for details:

<http://ieeexplore.ieee.org/iel1/38/7531/00310740.pdf?isNumber=7531&prod=JNL&arnumber=310740&arSt=83&ared=87&arAuthor=Blinn%2C+J.F.>

Encoding blend weights:  $I(x,y) = (\alpha R, \alpha G, \alpha B, \alpha)$

color at p = 
$$\frac{(\alpha_1 R_1, \alpha_1 G_1, \alpha_1 B_1) + (\alpha_2 R_2, \alpha_2 G_2, \alpha_2 B_2) + (\alpha_3 R_3, \alpha_3 G_3, \alpha_3 B_3)}{\alpha_1 + \alpha_2 + \alpha_3}$$

Implement this in two steps:

1. accumulate: add up the ( $\alpha$  premultiplied) RGB values at each pixel
2. normalize: divide each pixel's accumulated RGB by its  $\alpha$  value

# Gain Compensation: Getting rid of artifacts

- Simple gain adjustment
  - Compute average RGB intensity of each image in overlapping region
  - Normalize intensities by ratio of averages

# Blending Comparison

(b) Without gain compensation

(c) With gain compensation

(d) With gain compensation and multi-band blending

# Recognizing Panoramas

# Recognizing Panoramas

Input: N images

1. Extract SIFT points, descriptors from all images
2. Find K-nearest neighbors for each point (K=4)
3. For each image
  - a) Select M candidate matching images by counting matched keypoints (m=6)
  - b) Solve homography  $\mathbf{H}_{ij}$  for each matched image

# Recognizing Panoramas

Input: N images

1. Extract SIFT points, descriptors from all images
2. Find K-nearest neighbors for each point (K=4)
3. For each image
  - a) Select M candidate matching images by counting matched keypoints (m=6)
  - b) Solve homography  $\mathbf{H}_{ij}$  for each matched image
  - c) Decide if match is valid ( $n_i > 8 + 0.3 n_f$ )

# inliers

# keypoints in  
overlapping area

# Recognizing Panoramas (cont.)

(now we have matched pairs of images)

4. Make a graph of matched pairs

Find connected components of the graph

# Finding the panoramas

# Finding the panoramas

# Recognizing Panoramas (cont.)

(now we have matched pairs of images)

4. Find connected components

5. For each connected component

a) Solve for rotation and  $f$

b) Project to a surface (plane, cylinder, or sphere)

c) Render with multiband blending

# Finding the panoramas

# Homework 3

## CREATING PANORAMAS!

# Useful structures (defined in image.h)

- **Data structure for an point**

```
typedef struct{  
    float x, y;  
} point;
```

- **Data structure for a descriptor**

```
typedef struct{  
    point p; <-pixel location  
    int n; <-size of data  
    float *data;  
} descriptor;
```

- **Data structure for a match**

```
typedef struct{  
    point p, q; <-matching  
                points  
    int ai, bi; <-matching  
                indices of descriptor arrays  
    float distance; <-dist.  
                between matching descriptors  
} match;
```

# Overall algorithm

```
image panorama_image(image a, image b, float sigma, float thresh, int
nms, float inlier_thresh, int iters, int cutoff)
{
    // Calculate corners and descriptors
    descriptor *ad = harris_corner_detector(a, sigma, thresh, nms, &an);
    descriptor *bd = harris_corner_detector(b, sigma, thresh, nms, &bn);

    // Find matches
    match *m = match_descriptors(ad, an, bd, bn, &mn);

    // Run RANSAC to find the homography
    matrix H = RANSAC(m, mn, inlier_thresh, iters, cutoff);

    // Stitch the images together with the homography
    image combine = combine_images(a, b, H);

    return combine;
}
```

# 1. Harris corner detection

- TODO #1.1: Compute structure matrix  $S$
- TODO #1.2: Compute corneriness response map  $R$  from structure matrix  $S$
- TODO #1.3: Find local maxes in map  $R$  using non-maximum suppression
- TODO #1.4: Compute descriptors for final corners

# TODO #1.1: structure matrix

- Compute  $I_x$  and  $I_y$  using Sobel filters from HW2
- Create an empty image of 3 channels
  - Assign channel 1 to  $I_x^2$
  - Assign channel 2 to  $I_y^2$
  - Assign channel 3 to  $I_x * I_y$
- Compute weighted sum of neighbors
  - smooth the image with a gaussian of given sigma

# TODO #1.1.1: make a fast smoother

- Decompose a 2D gaussian to 2 1D convolutions.

Gaussian

Separable kernel

- Factors into product of two 1D Gaussians
- Discrete example:

$$\begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 1 \end{bmatrix}$$

$$h_{\sigma}(u, v) = \frac{1}{2\pi\sigma^2} e^{-\frac{u^2+v^2}{2\sigma^2}} = \left( \frac{1}{\sqrt{2\pi}\sigma} \exp^{-\frac{x^2}{2\sigma^2}} \right) \left( \frac{1}{\sqrt{2\pi}\sigma} \exp^{-\frac{y^2}{2\sigma^2}} \right)$$

# TODO #1.2: response map

- For each pixel of the given structure matrix S:
  - Get  $I_x^2$ ,  $I_y^2$  and  $I_x I_y$  from the 3 channels
  - Compute  $\text{Det}(S) = I_x^2 * I_y^2 - I_x I_y * I_x I_y$
  - Compute  $\text{Tr}(S) = I_x^2 + I_y^2$
  - Compute  $R = \text{Det}(S) - 0.06 * \text{Tr}(S) * \text{Tr}(S)$

# TODO #1.3: NMS

- For each pixel 'p' of the given response map R
  - get value(p)
  - loop over all neighboring pixels 'q' in a  $2w+1$  window
    - $\pm w$  around the current pixel location
    - if  $\text{value}(q) > \text{value}(p)$ ,  $\text{value}(p) = -999999$  (very low)
  - set 'p' to value(p)

# TODO #1.4: corner descriptors

- Given: Response map after NMS
- Initialize count; loop over each pixel
  - if pixel value  $>$  threshold, increment count
- Initialize descriptor array of size 'count'
- Loop over each pixel again
  - if pixel value  $>$  threshold, create descriptor for that pixel
    - use `describe_index()` defined in `harris_image.c`
  - add this new descriptor to the array

## 2. Matching descriptors

- TODO #2.1: Implement L1 distance
- TODO #2.2.1: Find best matches from descriptor array “a” to descriptor array “b”
- TODO #2.2.2: Eliminate duplicate matches to ensure one-to-one match between “a” and “b”
- TODO #2.3: Project points given a homography and compute inliers from an array of matches
- TODO #2.4: Implement RANSAC algorithm
- TODO #2.5: Combine images

# TODO #2.1: Distance Metrics

- For comparing patches we'll use L1 distance.

```
// Calculates L1 distance between two floating point arrays.  
// float *a, *b: arrays to compare.  
// int n: number of values in each array.  
// returns: l1 distance between arrays (sum of absolute differences).  
float l1_distance(float *a, float *b, int n)  
{  
    // TODO: return the correct number.  
    return 0;  
}
```

# TODO #2.2.1: best matches

- For each descriptor ' $a_r$ ' in array ' $a$ ':
  - initialize min\_distance and best\_index
  - for each descriptor ' $b_s$ ' in array ' $b$ ':
  - compute L1 distance between  $a_r$  and  $b_s$ 
    - sum of absolute differences
  - if distance < min\_distance:
    - update min\_distance and best\_index

# TODO #2.2.2: remove duplicates

- Sort the matches based on distance (shortest is first)
- Initialize an array of 0s called 'seen'
- Loop over all matches:
  - if b-index of current match is  $\neq 1$  in 'seen'
    - set the corresponding value in 'seen' to 1
    - retain the match
  - else, discard the match

# TODO #2.3.1: point projection

- Given point  $p$ , set matrix  $c_{3 \times 1} = [x\text{-coord}, y\text{-coord}, 1]$
- Compute  $M_{3 \times 1} = H_{3 \times 3} * c_{3 \times 1}$  with given Homography
- Compute  $x, y$  coordinates of a point ' $q$ ':
  - $x\text{-coord}: M[0] / M[2]$
  - $y\text{-coord}: M[1] / M[2]$
- Return point ' $q$ '

# TODO #2.3.2, 2.3.3: L2 distance and model inliers

- Loop over each match from array of matches (starting from end):
  - project point 'p' of match using given 'H'
  - compute L2 distance between point 'q' of match and the projected point
  - if distance < given threshold:
    - it is an inlier; bring match to the front of array (swap)
    - update inlier count

# TODO #2.3.4:Fitting the homography

- Use the matrix operations discussed in class to solve equations like  $M \cdot a = b$ .
- Most of this is already implemented
  - you just have to fill in the matrices  $M$  and  $b$  with our match information.

# TODO #2.4-2.5: implement RANSAC

- For each iteration:
  - compute homography with 4 random matches
    - call `compute_homography()` with argument 4
  - if homography is empty matrix, continue
  - else compute inliers with this homography
  - if `#inliers > max_inliers`:
    - compute new homography with all inliers
    - update `best_homography` with this new homography
    - update `max_inliers` with `#inliers` computed with this new homography unless new homography is empty
    - if updated `max_inliers > given cutoff`: return `best_homography`
- Return `best_homography`

# TODO #2.6: combine images

- Project corners of image 'b' and create a big empty image 'c' to place image 'a' and projected 'b'. This part is given in the code.
- For each pixel in image 'a', get pixel value and assign it to 'c' after proper offset
- For each pixel in image 'c' within projected bounds:
  - project to image 'b' using given homography
  - get pixel value at projected location using bilinear interpolation
  - assign the value to 'c' after proper offset

# 3. Cylindrical Projection

- Implement cylindrical projection for an image
  - See lecture slides for the formulas
  - See Tryhw3, which will call the panorama code to do the stitching.
  - See code for the code stub you will fill in to cylinderize an image.

Have Fun
