

Database Systems

DATA 514

Lecture 5: E/R Diagrams and Constraints

Database Design

What it is:

- Starting from scratch, design the database schema: relation, attributes, keys, foreign keys, constraints etc

Why it's hard

- The database will be in operation for a very long time (years). Updating the schema while in production is very expensive (why?)

Database Design

- Consider issues such as:
 - What entities to model
 - How entities are related
 - What constraints exist in the domain
- Several formalisms exists
 - We discuss E/R diagrams
- Reading: Sec. 4.1-4.6

Database Design Process

Conceptual Model:

Relational Model:
Tables + constraints
And also functional dep.

Normalization:
Eliminates anomalies

Conceptual Schema

Physical storage details

Physical Schema

Entity / Relationship Diagrams

- Entity set = a class
 - An entity = an object

Product

- Attribute

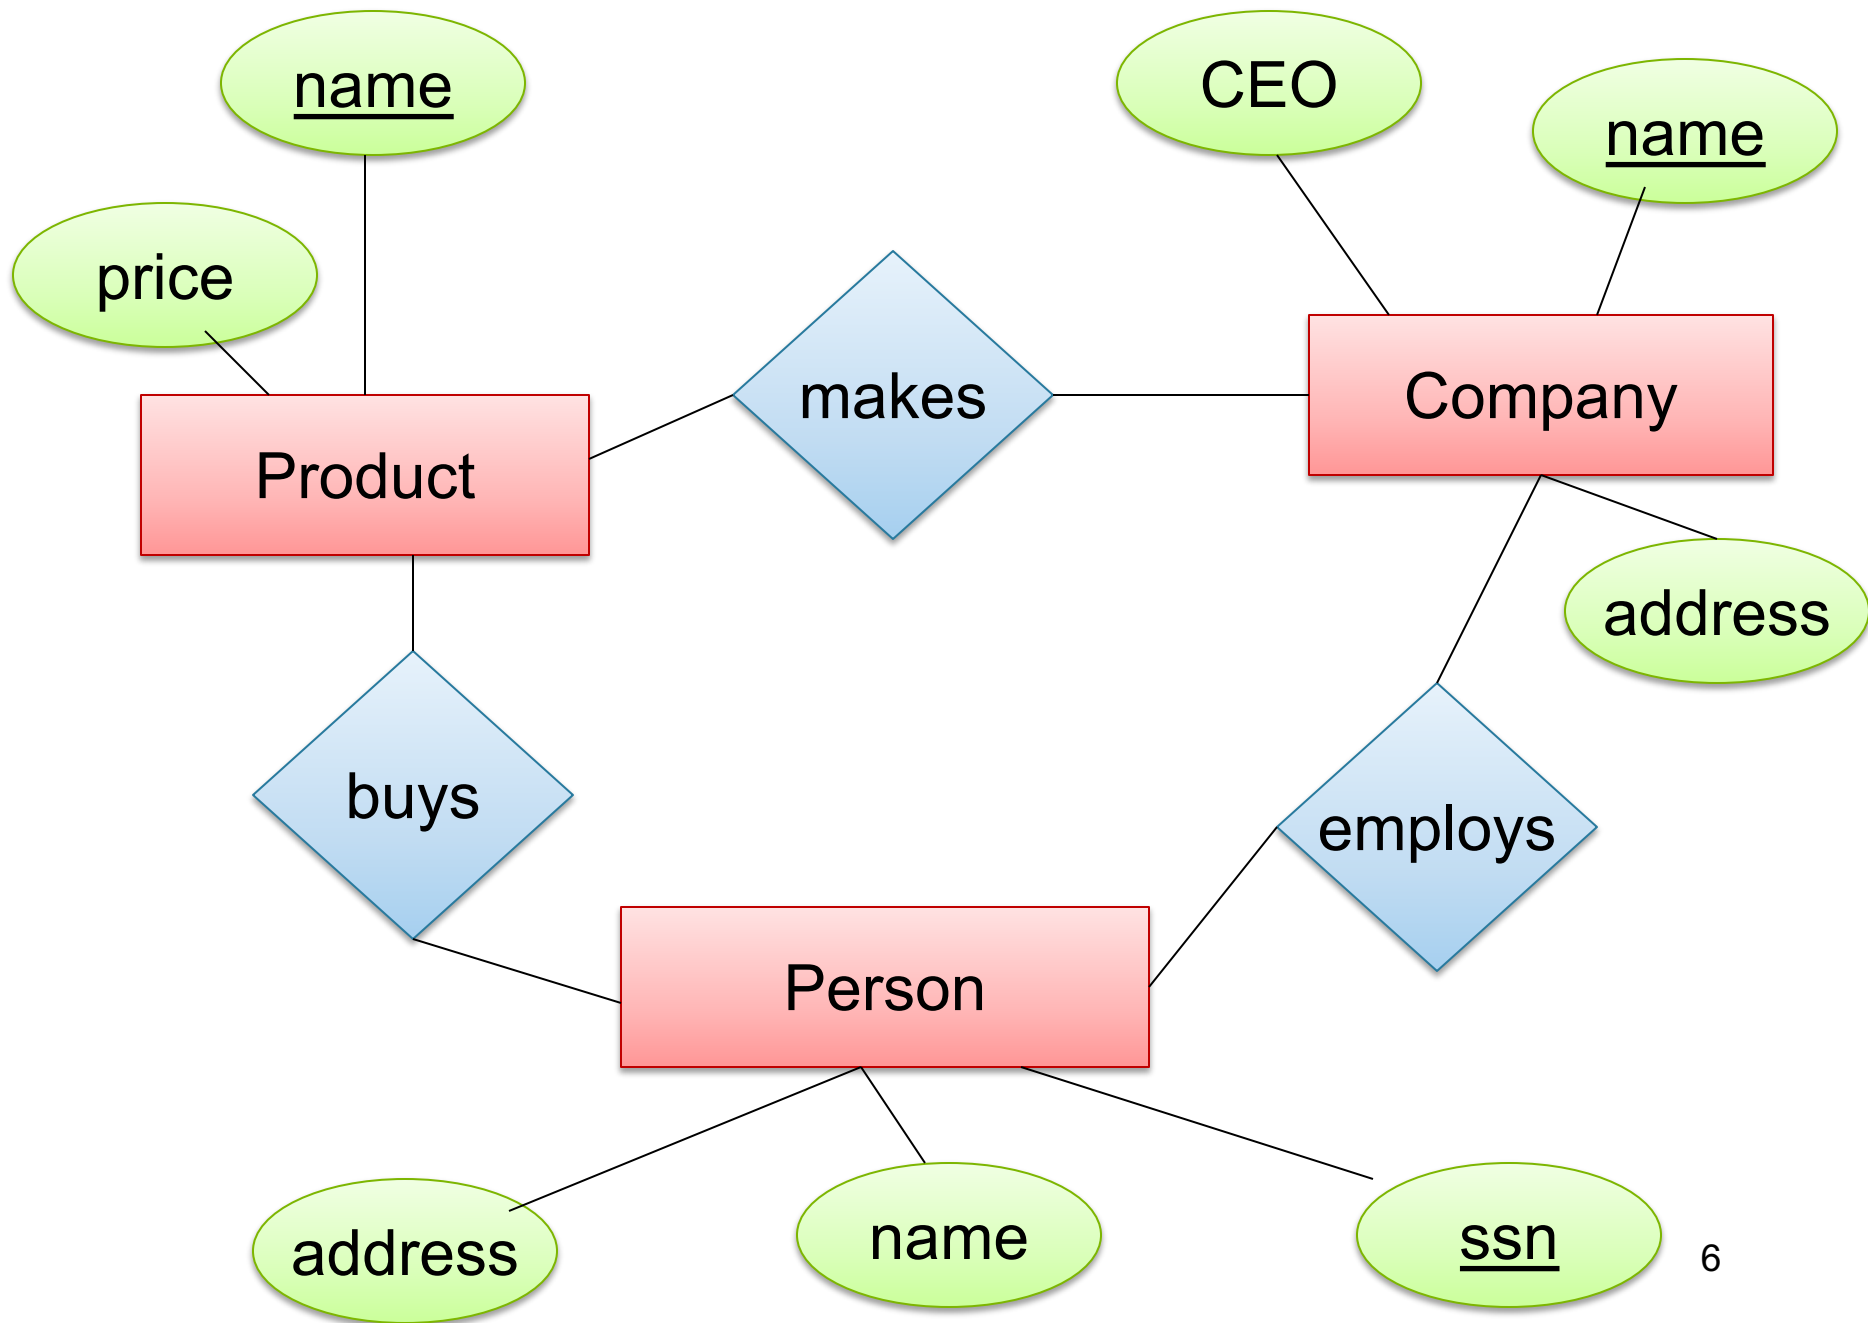

city

- Relationship

makes

Keys in E/R Diagrams

- Every entity set must have a key

What is a Relation ?

- A mathematical definition:
 - if A, B are sets, then a relation R is a subset of $A \times B$
- $A = \{1, 2, 3\}$, $B = \{a, b, c, d\}$,

$$A \times B = \{(1, a), (1, b), \dots, (3, d)\}$$

$$R = \{(1, a), (1, c), (3, b)\}$$

- **makes** is a subset of **Product** \times **Company**:

Multiplicity of E/R Relations

- one-one:

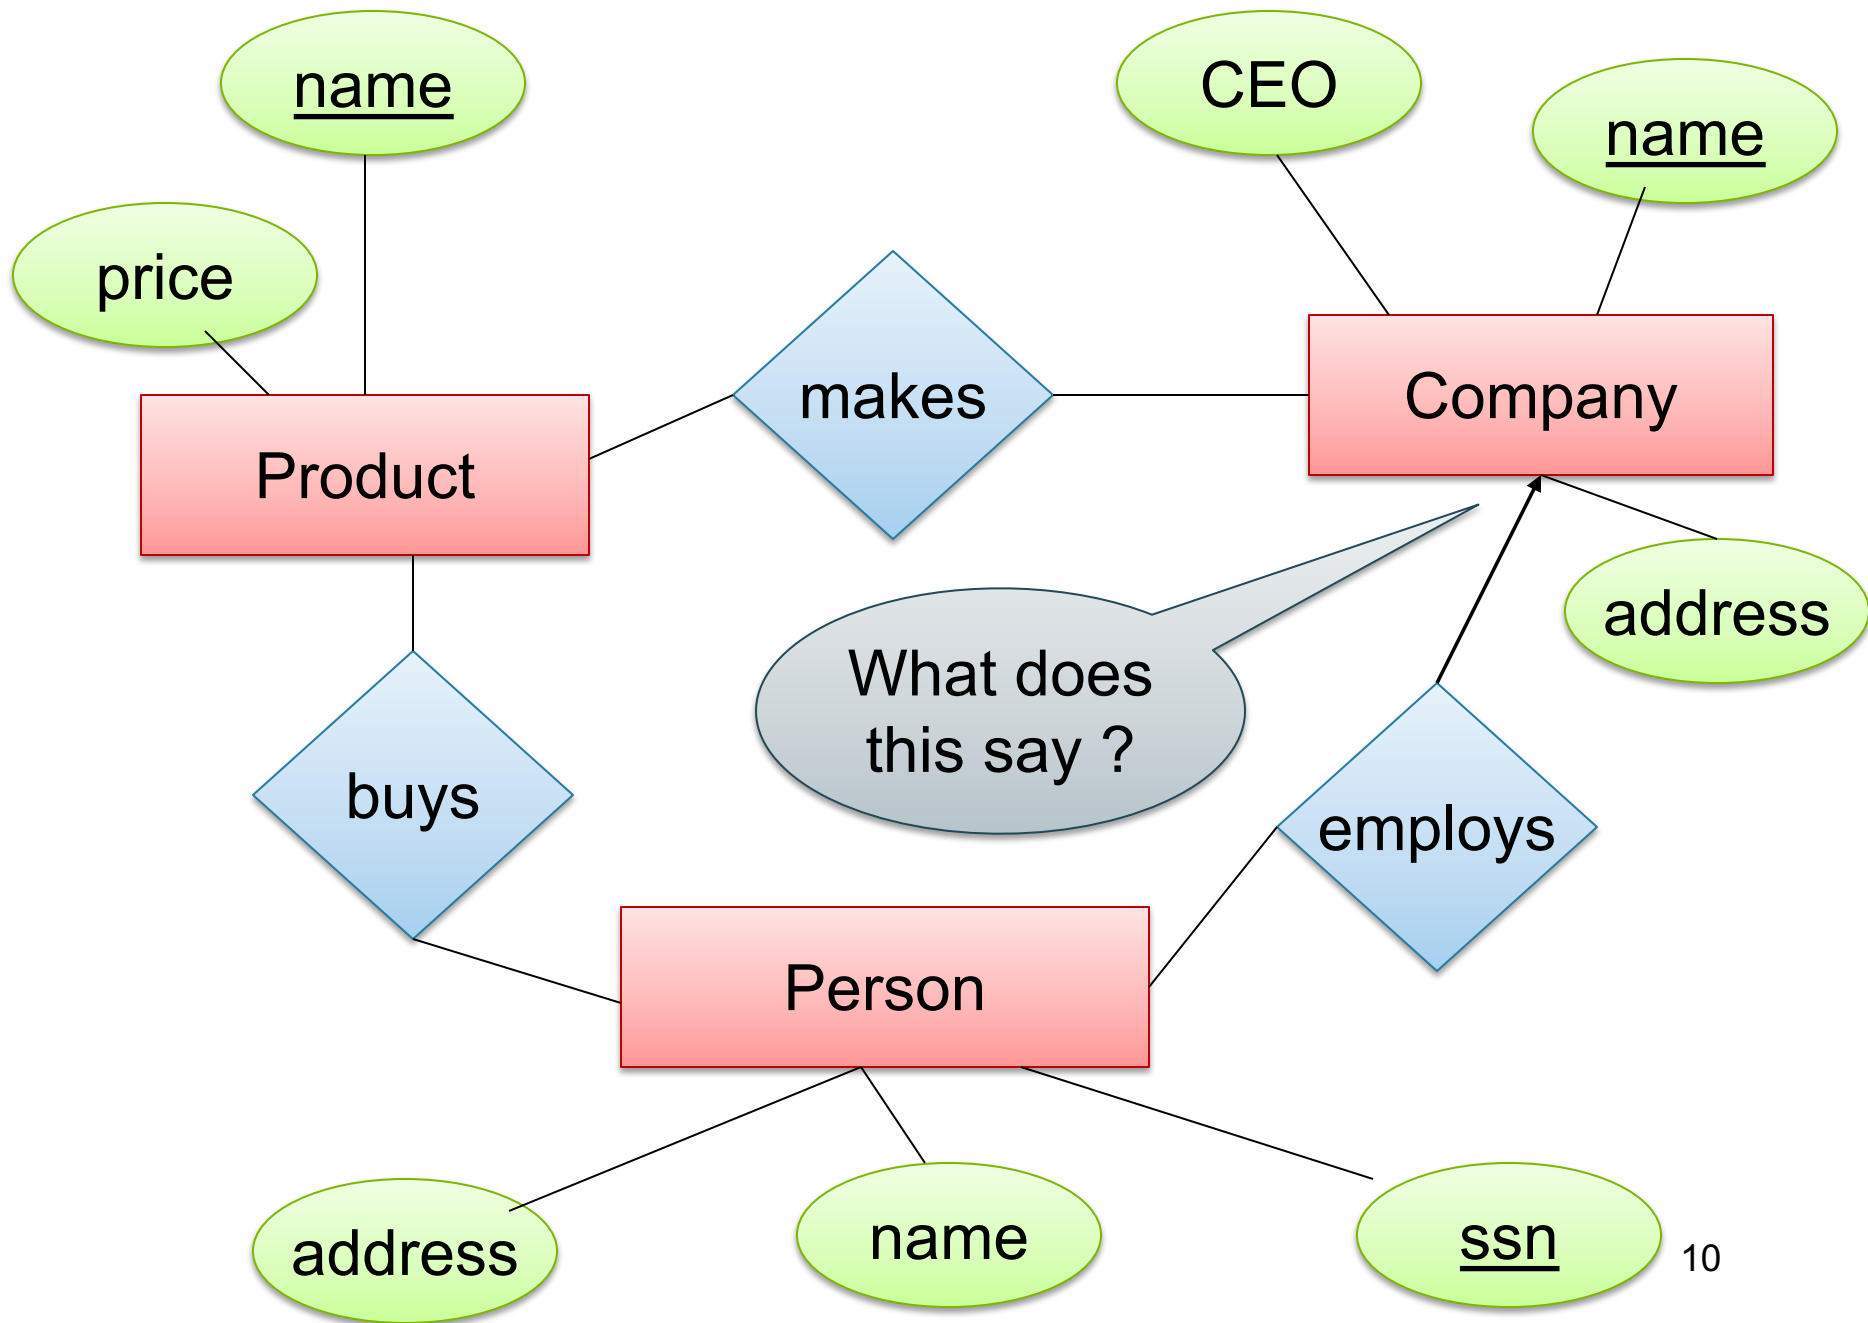

- many-one

- many-many

Multi-way Relationships

How do we model a purchase relationship between buyers, products and stores?

Can still model as a mathematical set (Q. how ?)

A. As a set of triples $\subseteq \text{Person} \times \text{Product} \times \text{Store}$

Arrows in Multiway Relationships

Q: What does the arrow mean ?

A: A given person buys a given product from at most one store

[Arrow pointing to E means that if we select one entity from each of the other entity sets in the relationship, those entities are related to at most one entity in E]

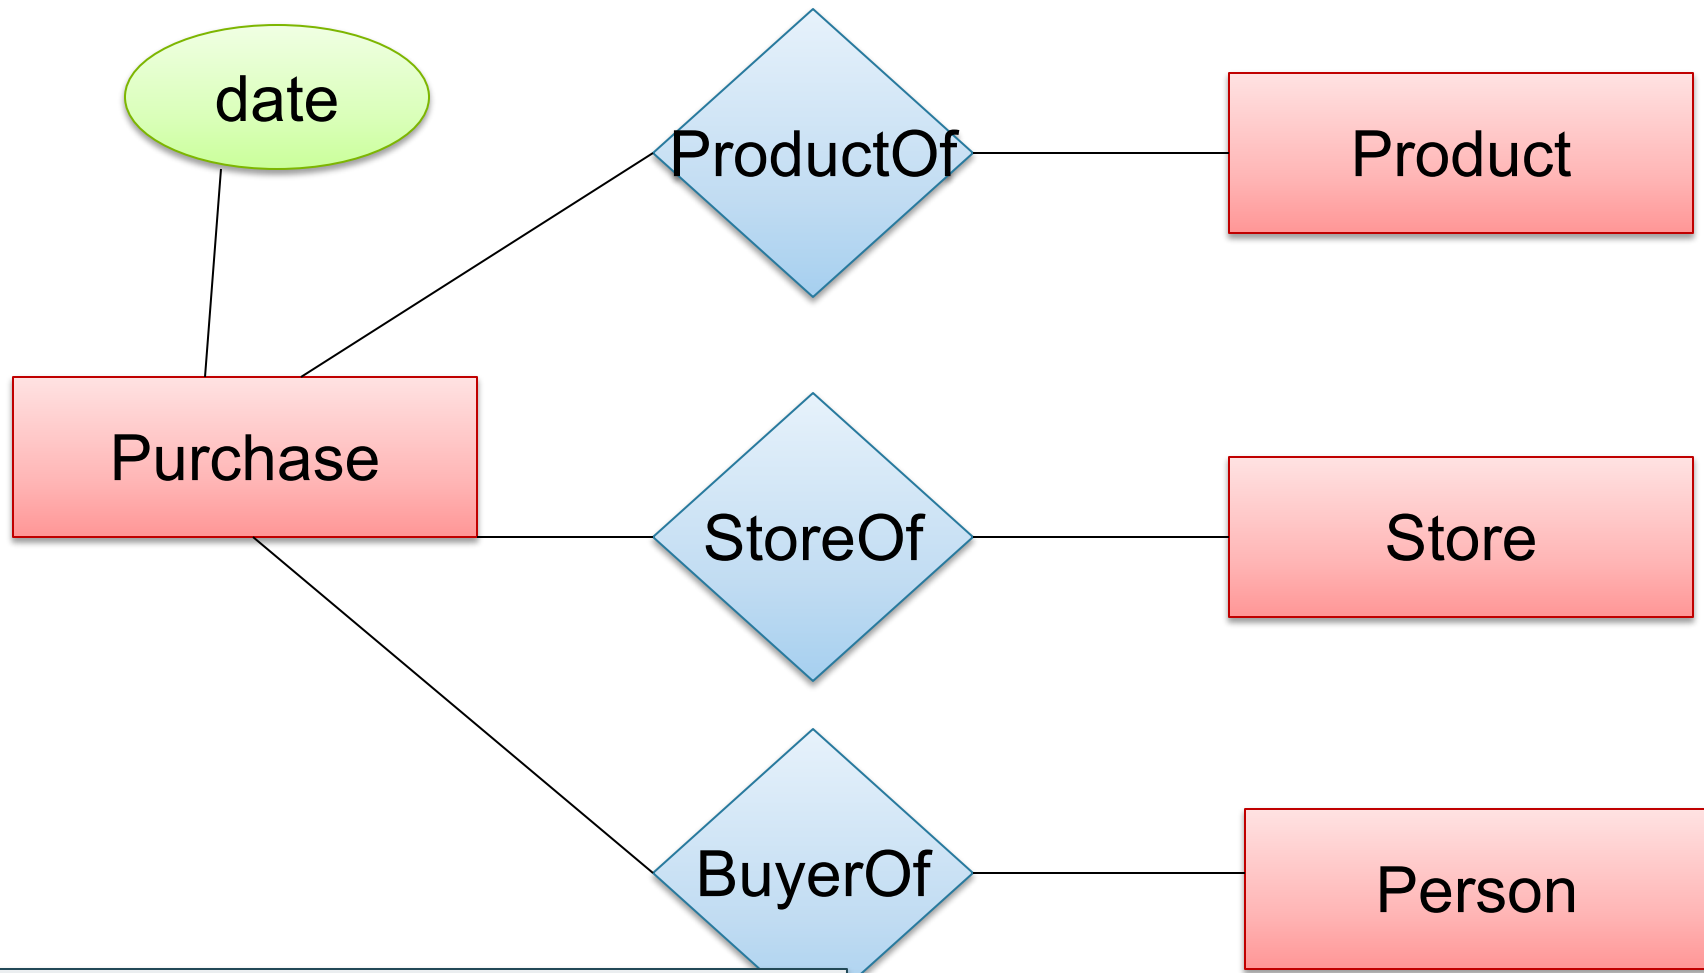

Arrows in Multiway Relationships

Q: What does the arrow mean ?

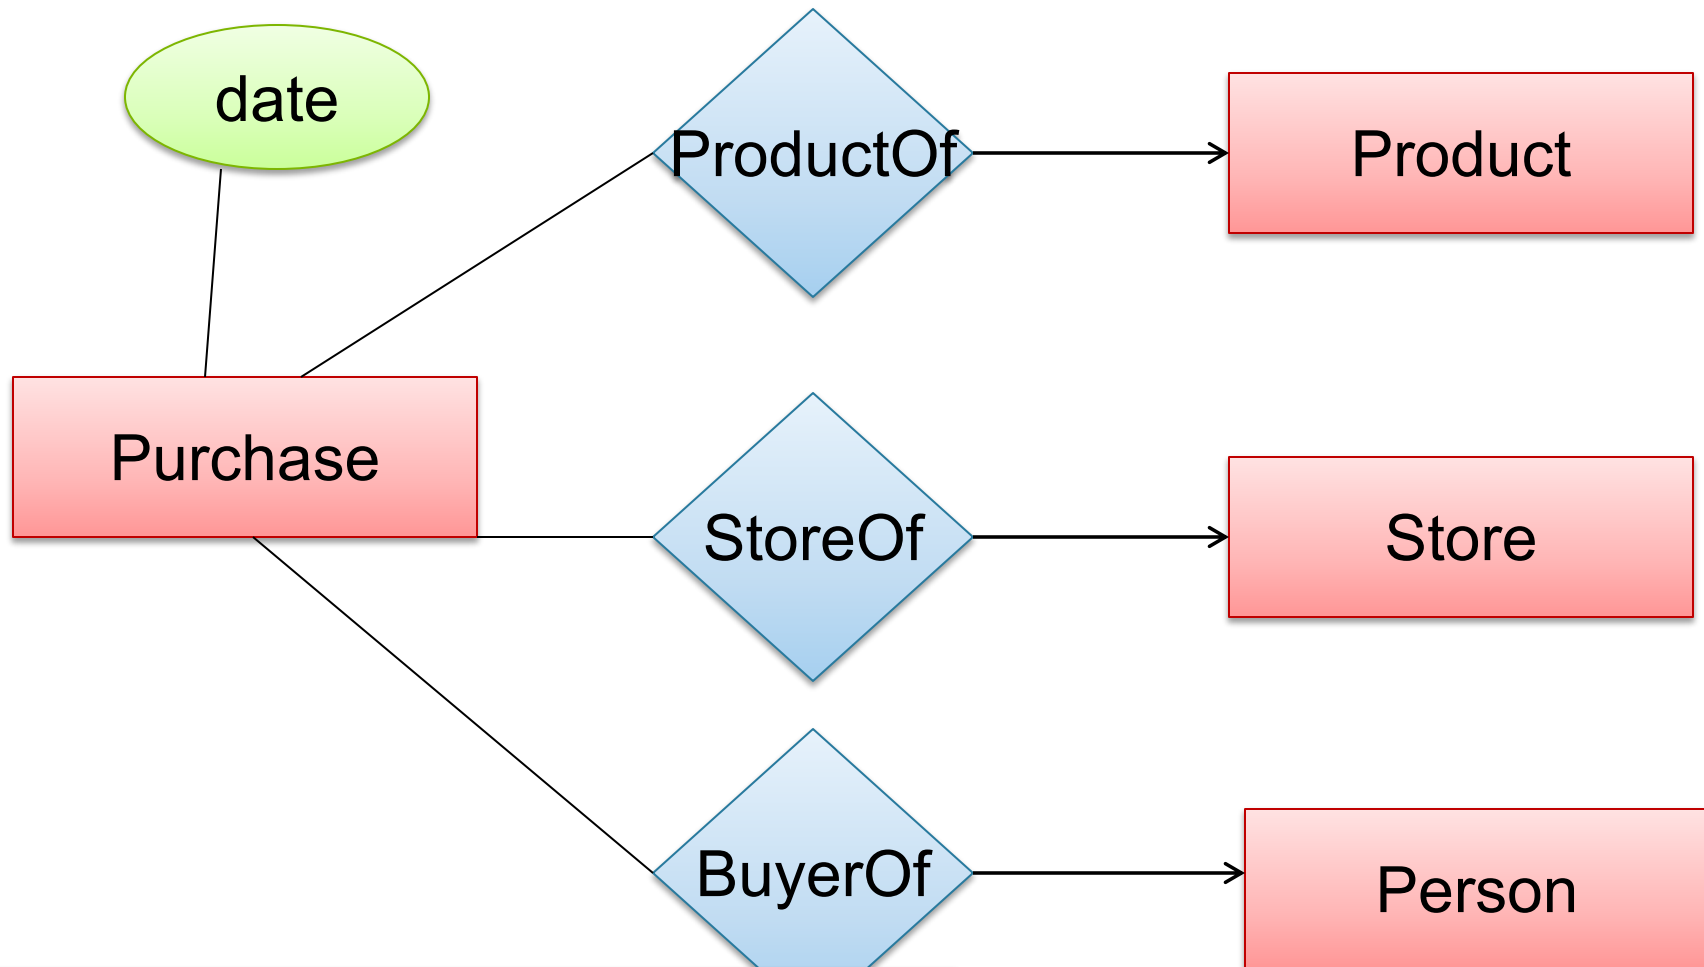

A: A given person buys a given product from at most one store
AND every store sells to every person at most one product

Converting Multi-way Relationships to Binary

Arrows go in which direction?

Converting Multi-way Relationships to Binary

Make sure you understand why!

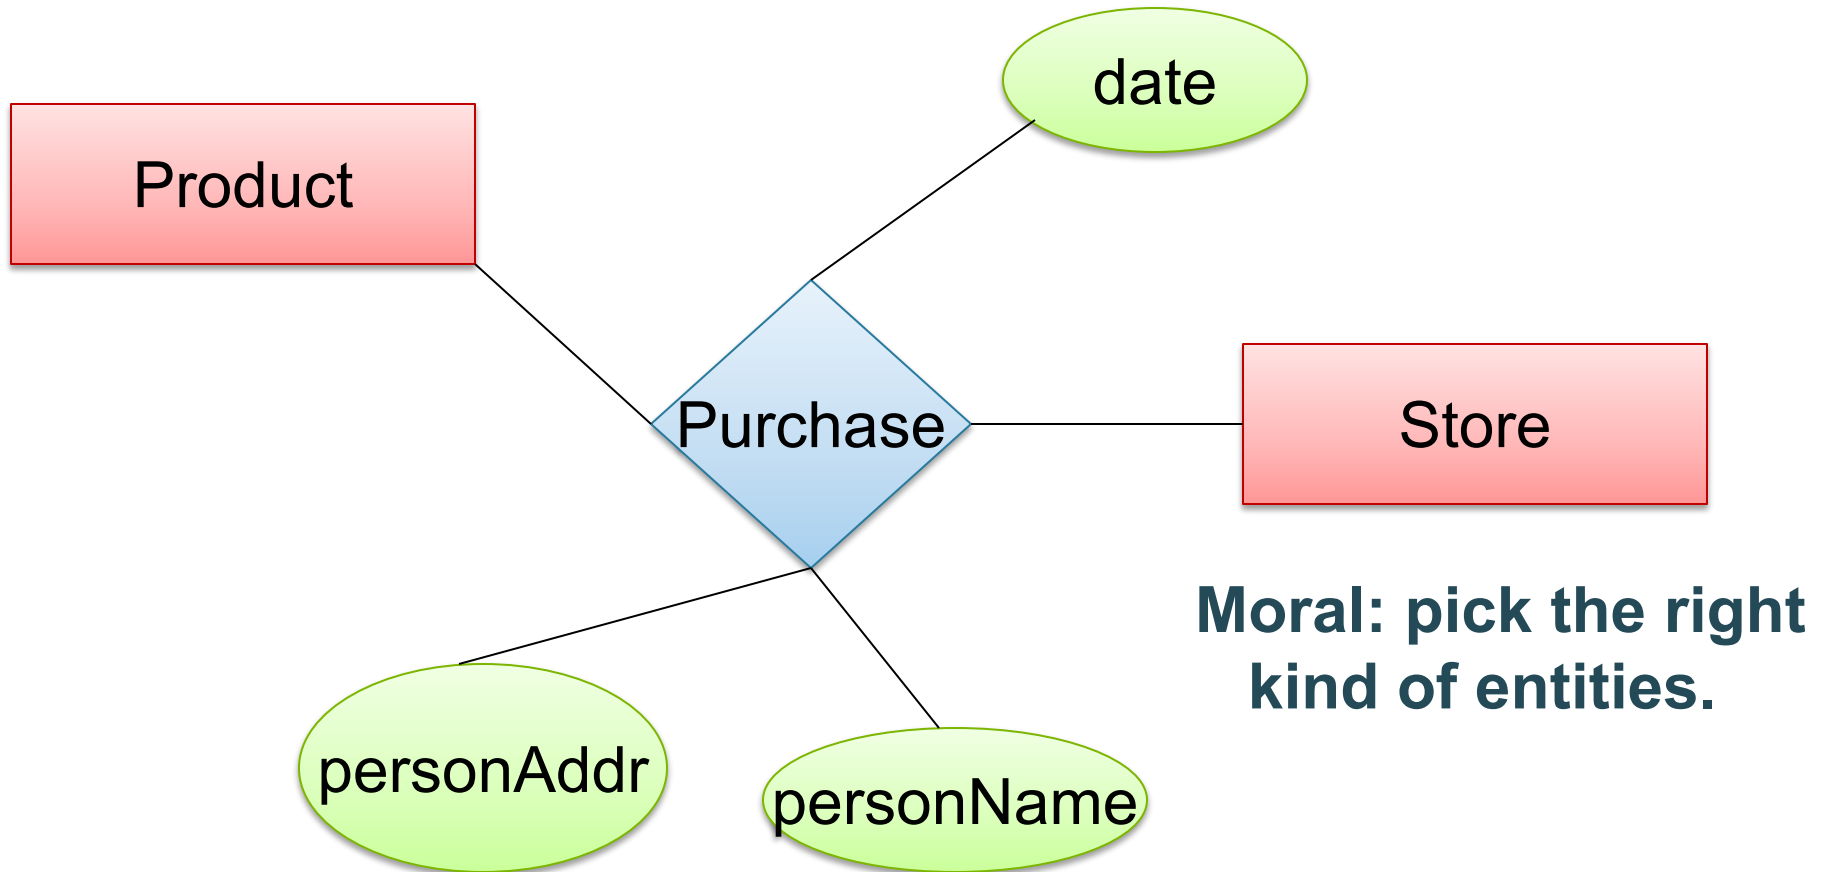

3. Design Principles

What's wrong?

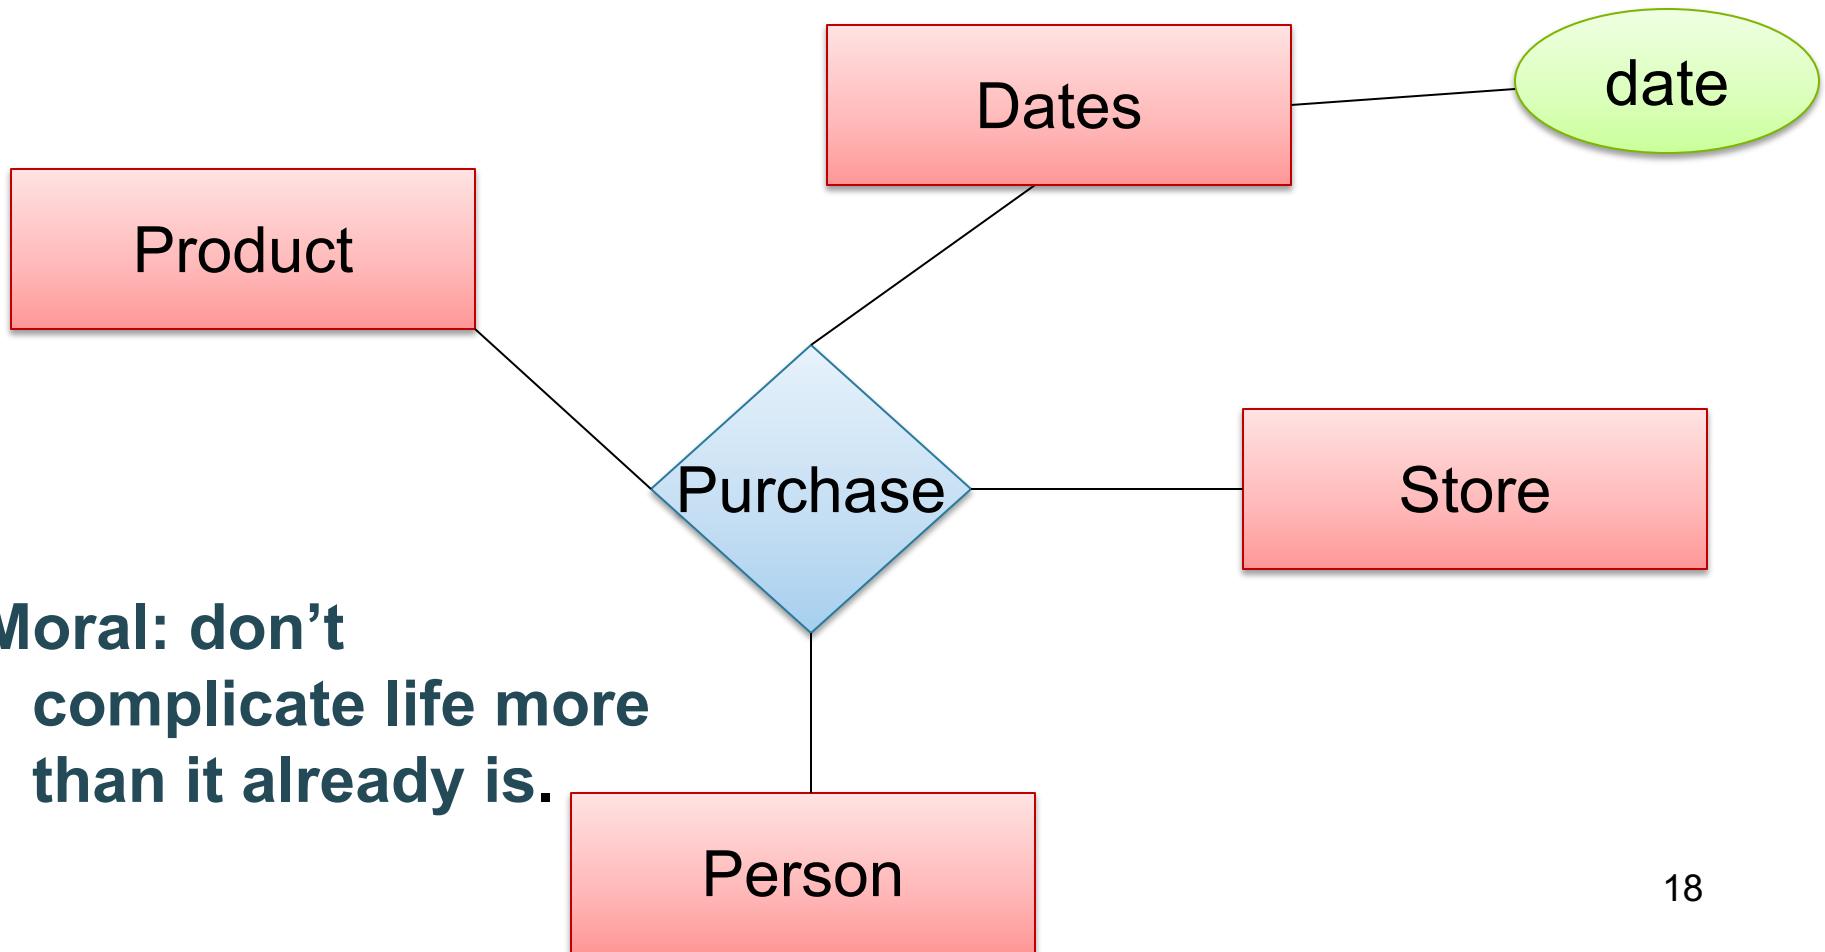

Moral: be faithful to the specifications of the app!

Design Principles: What's Wrong?

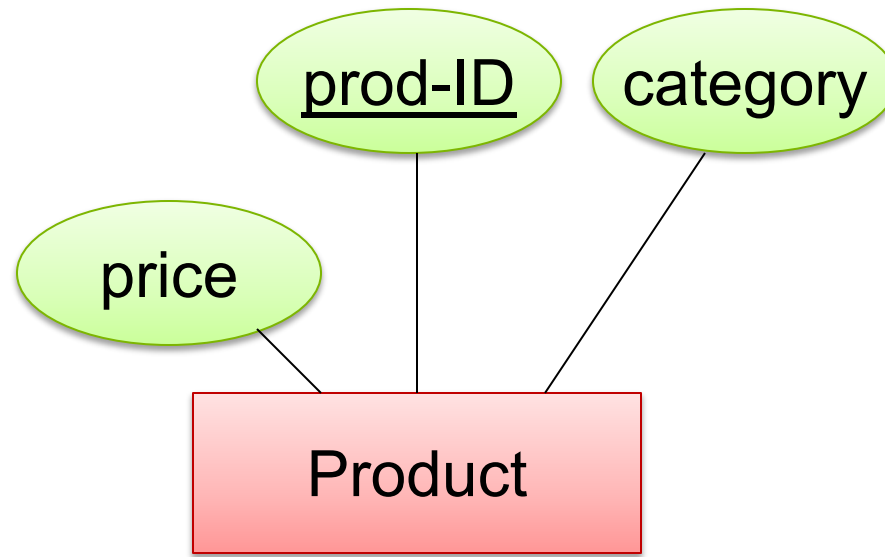

Design Principles: What's Wrong?

From E/R Diagrams to Relational Schema

- Entity set \rightarrow relation
- Relationship \rightarrow relation

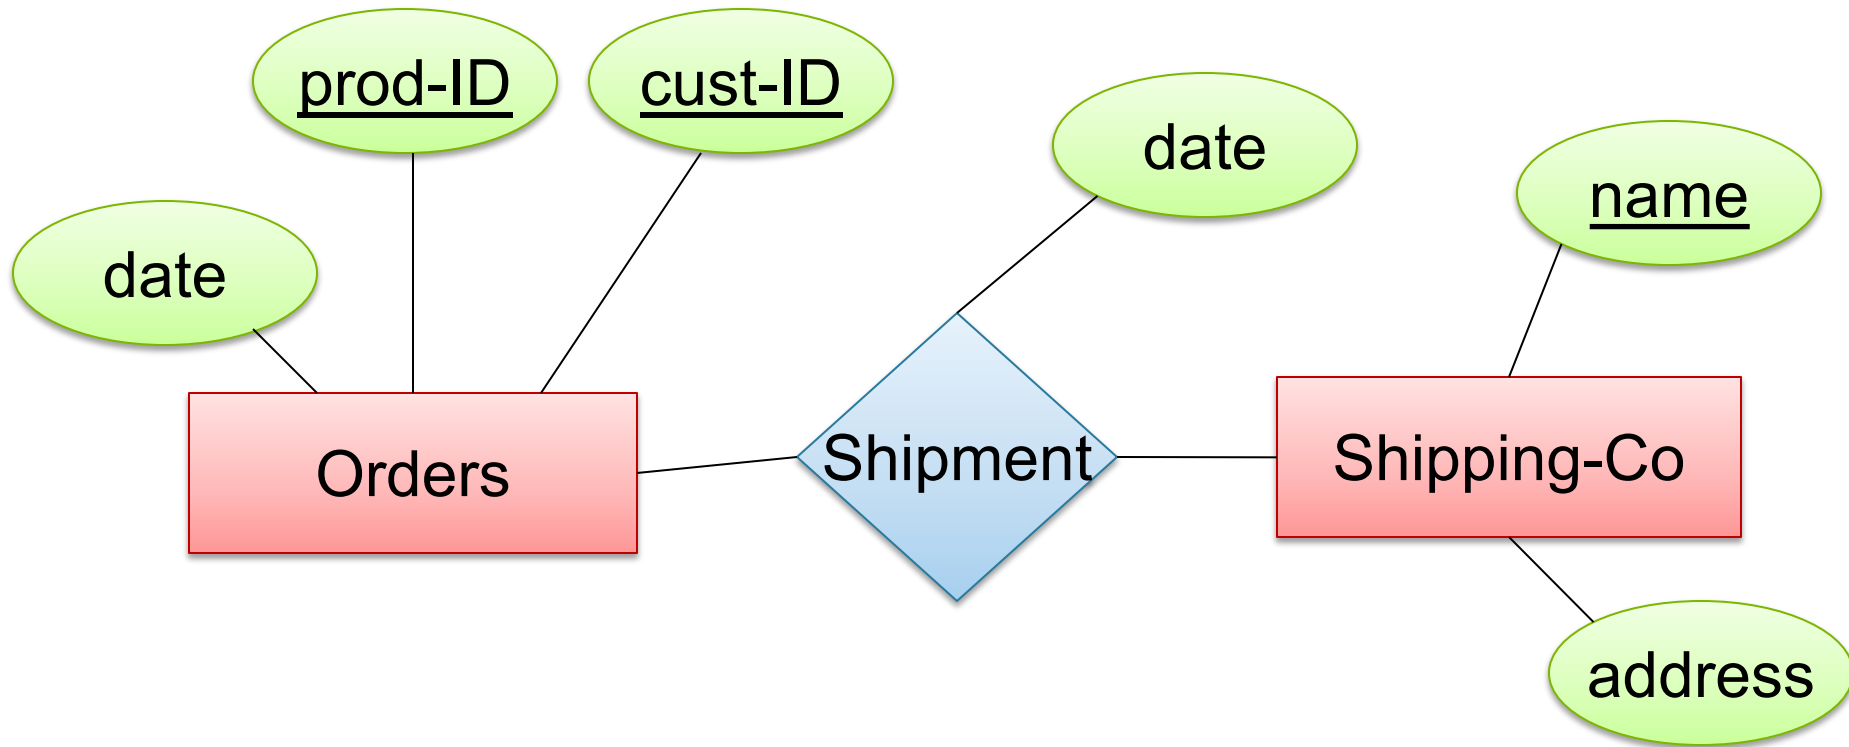

Entity Set to Relation

Product(prod-ID, category, price)

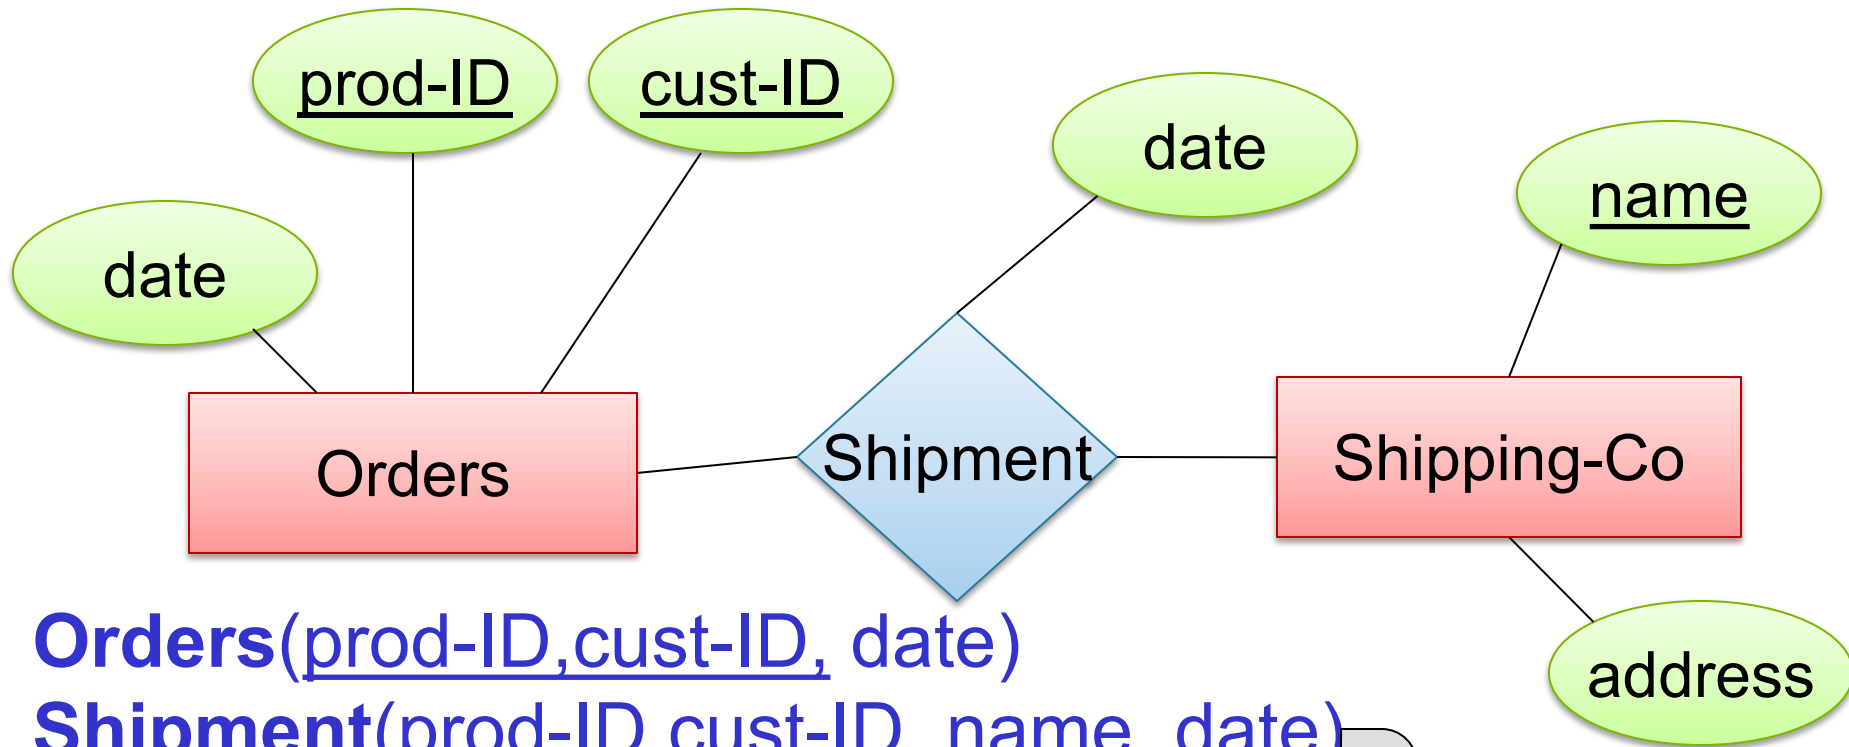

<u>prod-ID</u>	category	price
Gizmo55	Camera	99.99
Pokemn19	Toy	29.99

N-N Relationships to Relations

Represent this in relations

N-N Relationships to Relations

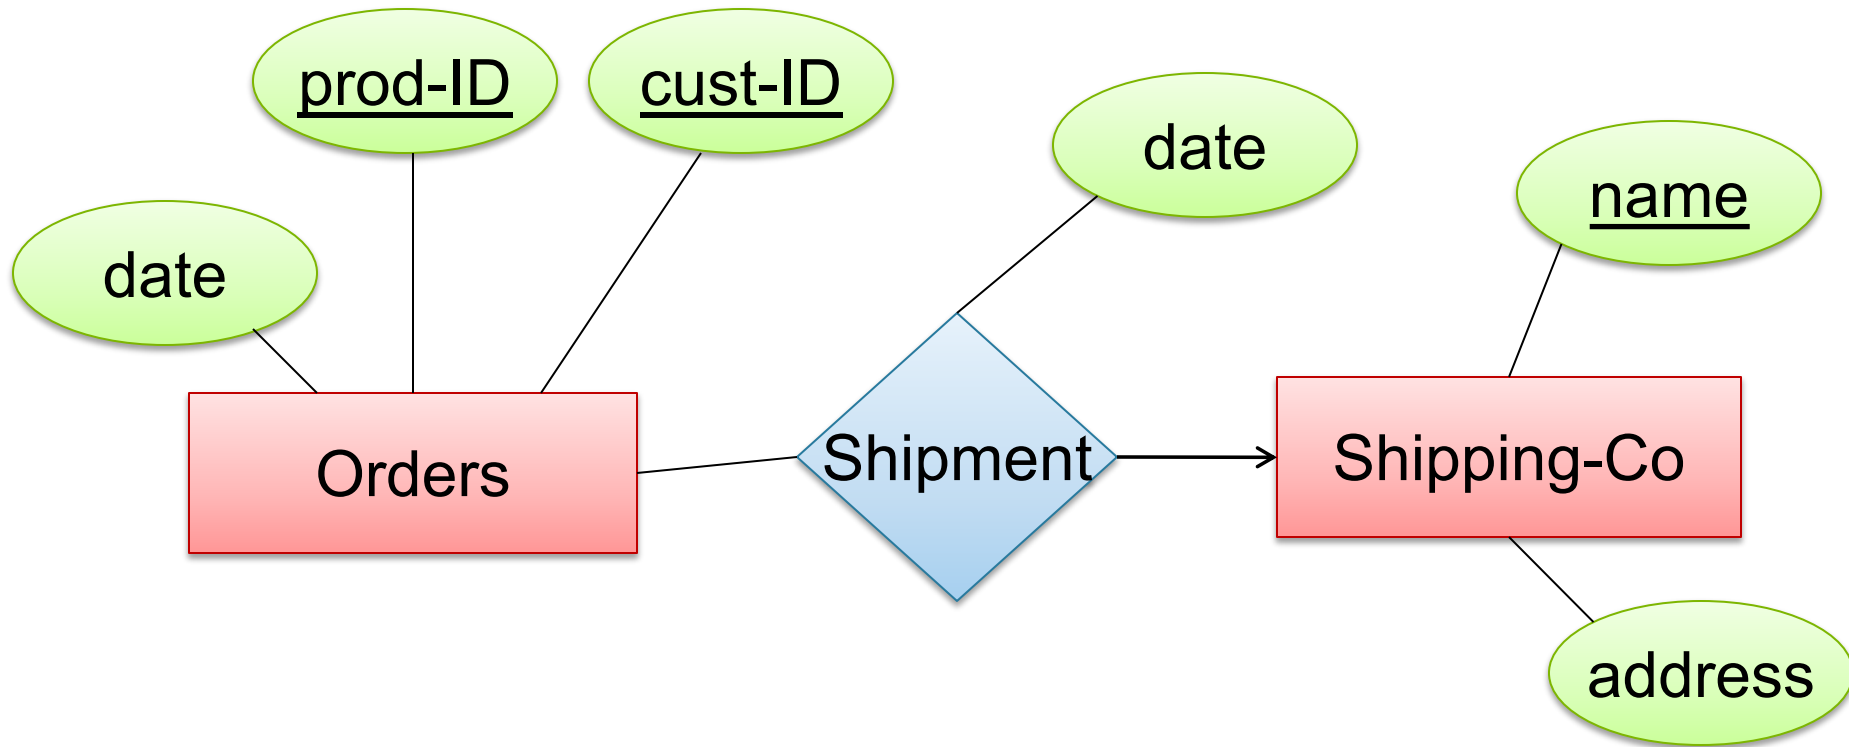

Orders(prod-ID, cust-ID, date)

Shipment(prod-ID, cust-ID, name, date)

Shipping-Co(name, address)

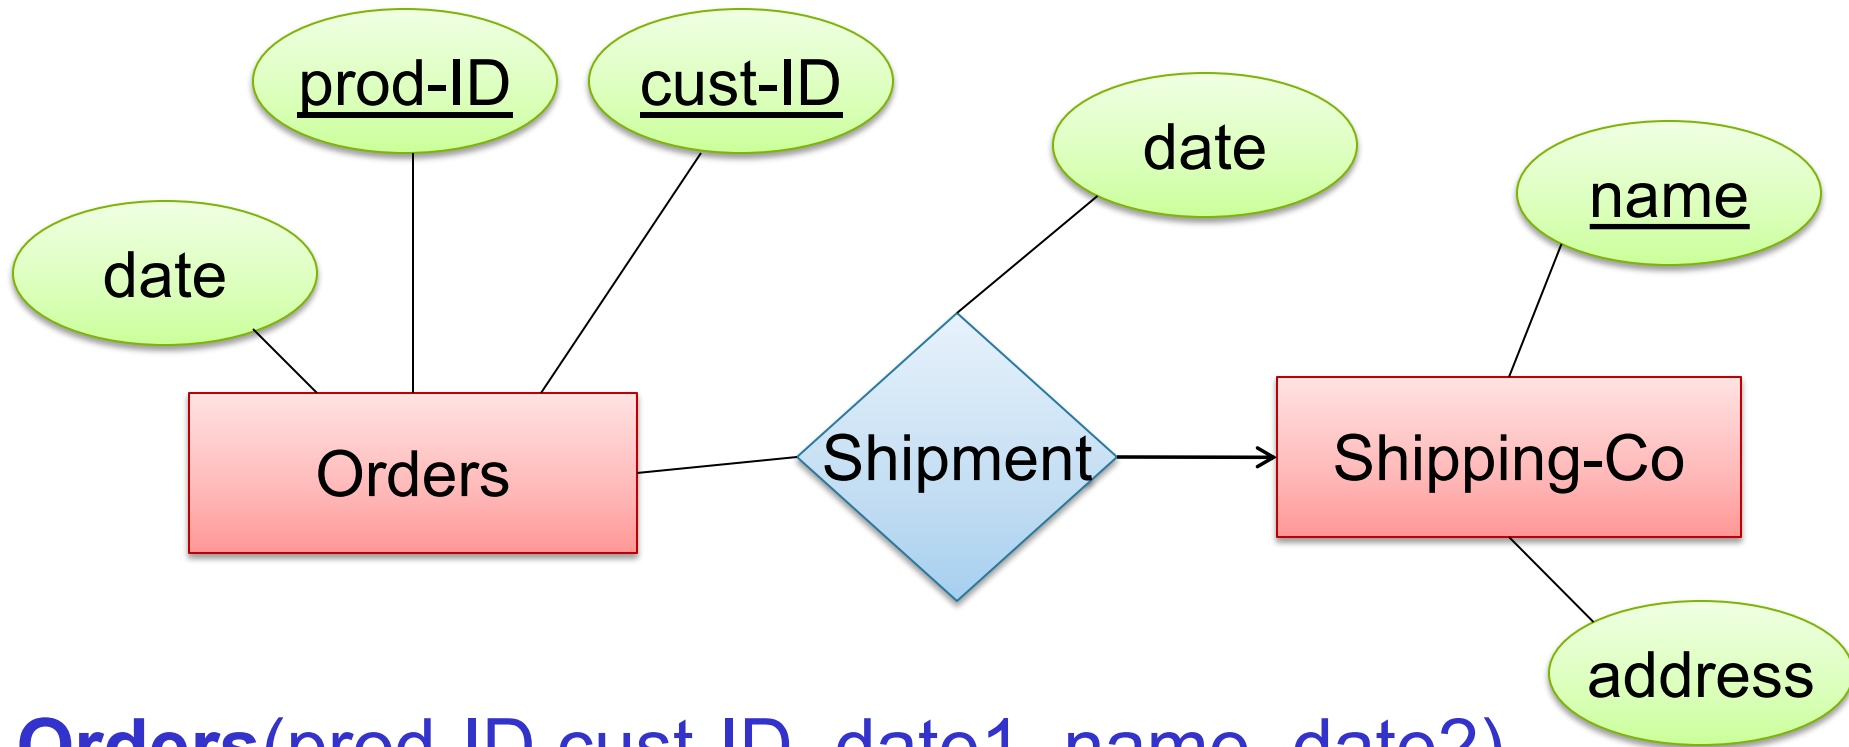

<u>prod-ID</u>	<u>cust-ID</u>	<u>name</u>	date
Gizmo55	Joe12	UPS	4/10/2011
Gizmo55	Joe12	FEDEX	4/9/2011

N-1 Relationships to Relations

Represent this in relations

N-1 Relationships to Relations

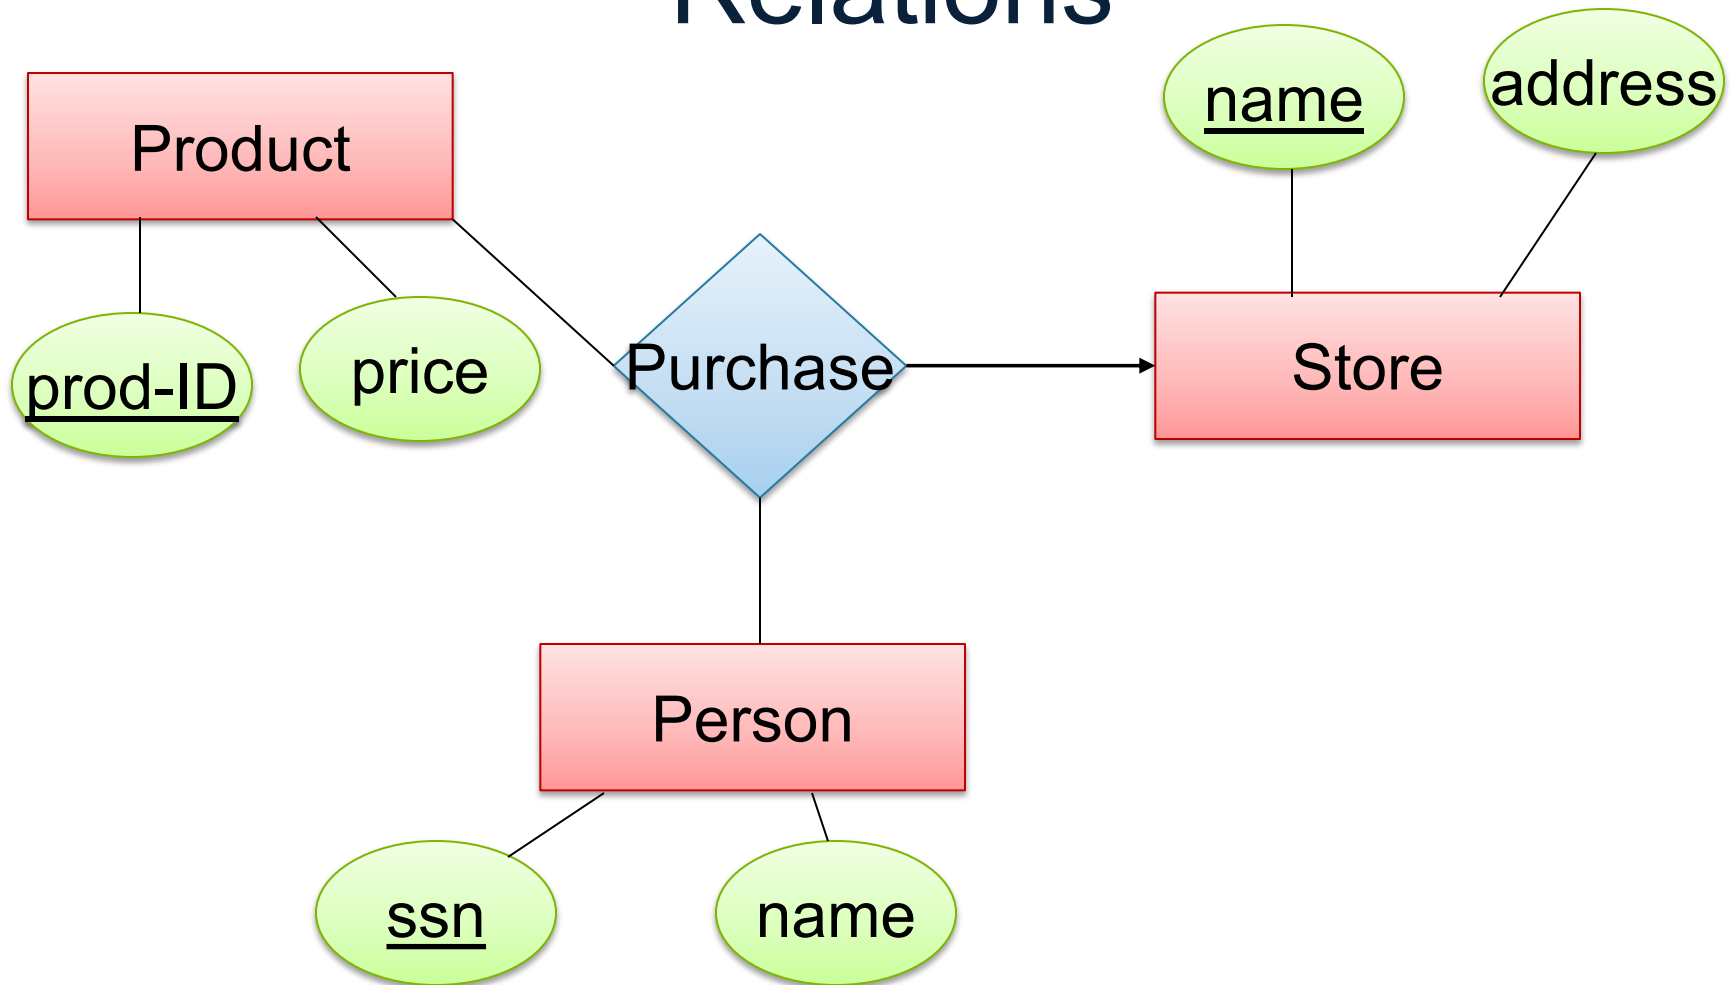

Orders(prod-ID, cust-ID, date1, name, date2)

Shipping-Co(name, address)

Remember: no separate relations for many-one relationship

Multi-way Relationships to Relations

Purchase(prod-ID, ssn, name)

Modeling Subclasses

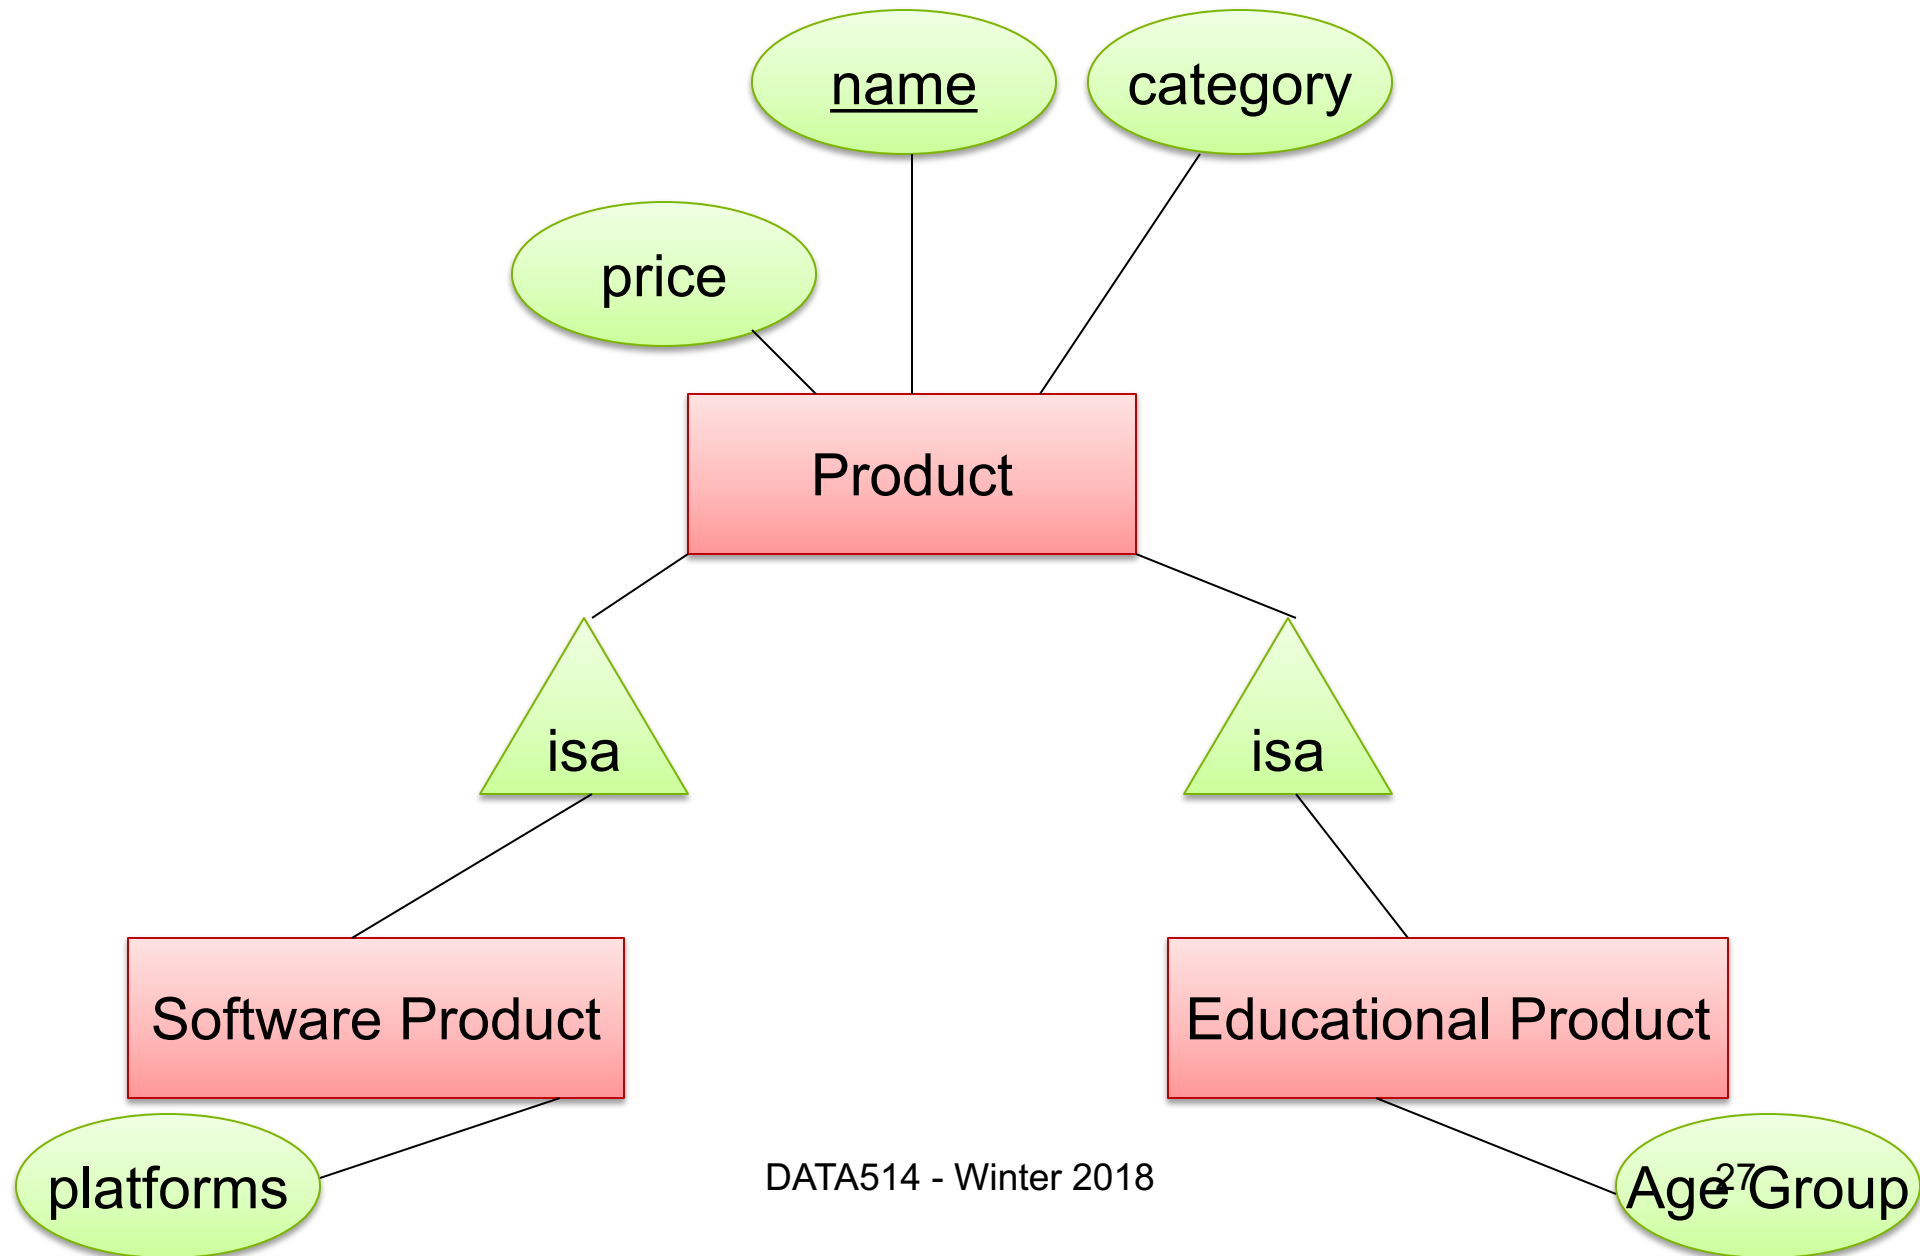

Some objects in a class may be special

- define a new class
- better: define a *subclass*

So --- we define subclasses in E/R

Subclasses

Subclasses to Relations

Product

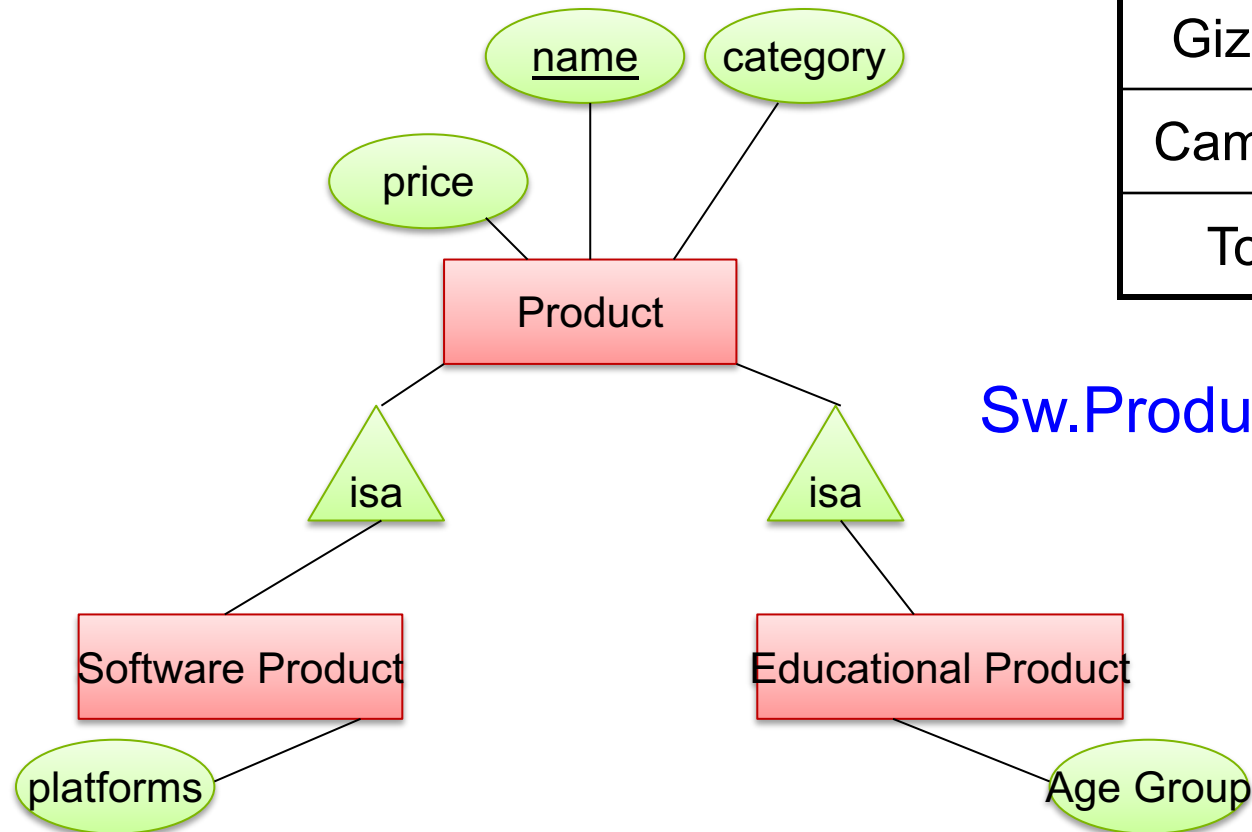

<u>Name</u>	Price	Category
Gizmo	99	gadget
Camera	49	photo
Toy	39	gadget

Sw.Product

<u>Name</u>	platforms
Gizmo	unix

Ed.Product

<u>Name</u>	Age Group
Gizmo	toddler
Toy	retired

Other ways to convert are possible

Modeling Union Types with Subclasses

Say: each piece of furniture is owned either by a person or by a company

Modeling Union Types with Subclasses

Say: each piece of furniture is owned either by a person or by a company

Solution 1. Acceptable but imperfect (What's wrong ?)

Modeling Union Types with Subclasses

Solution 2: better, more laborious

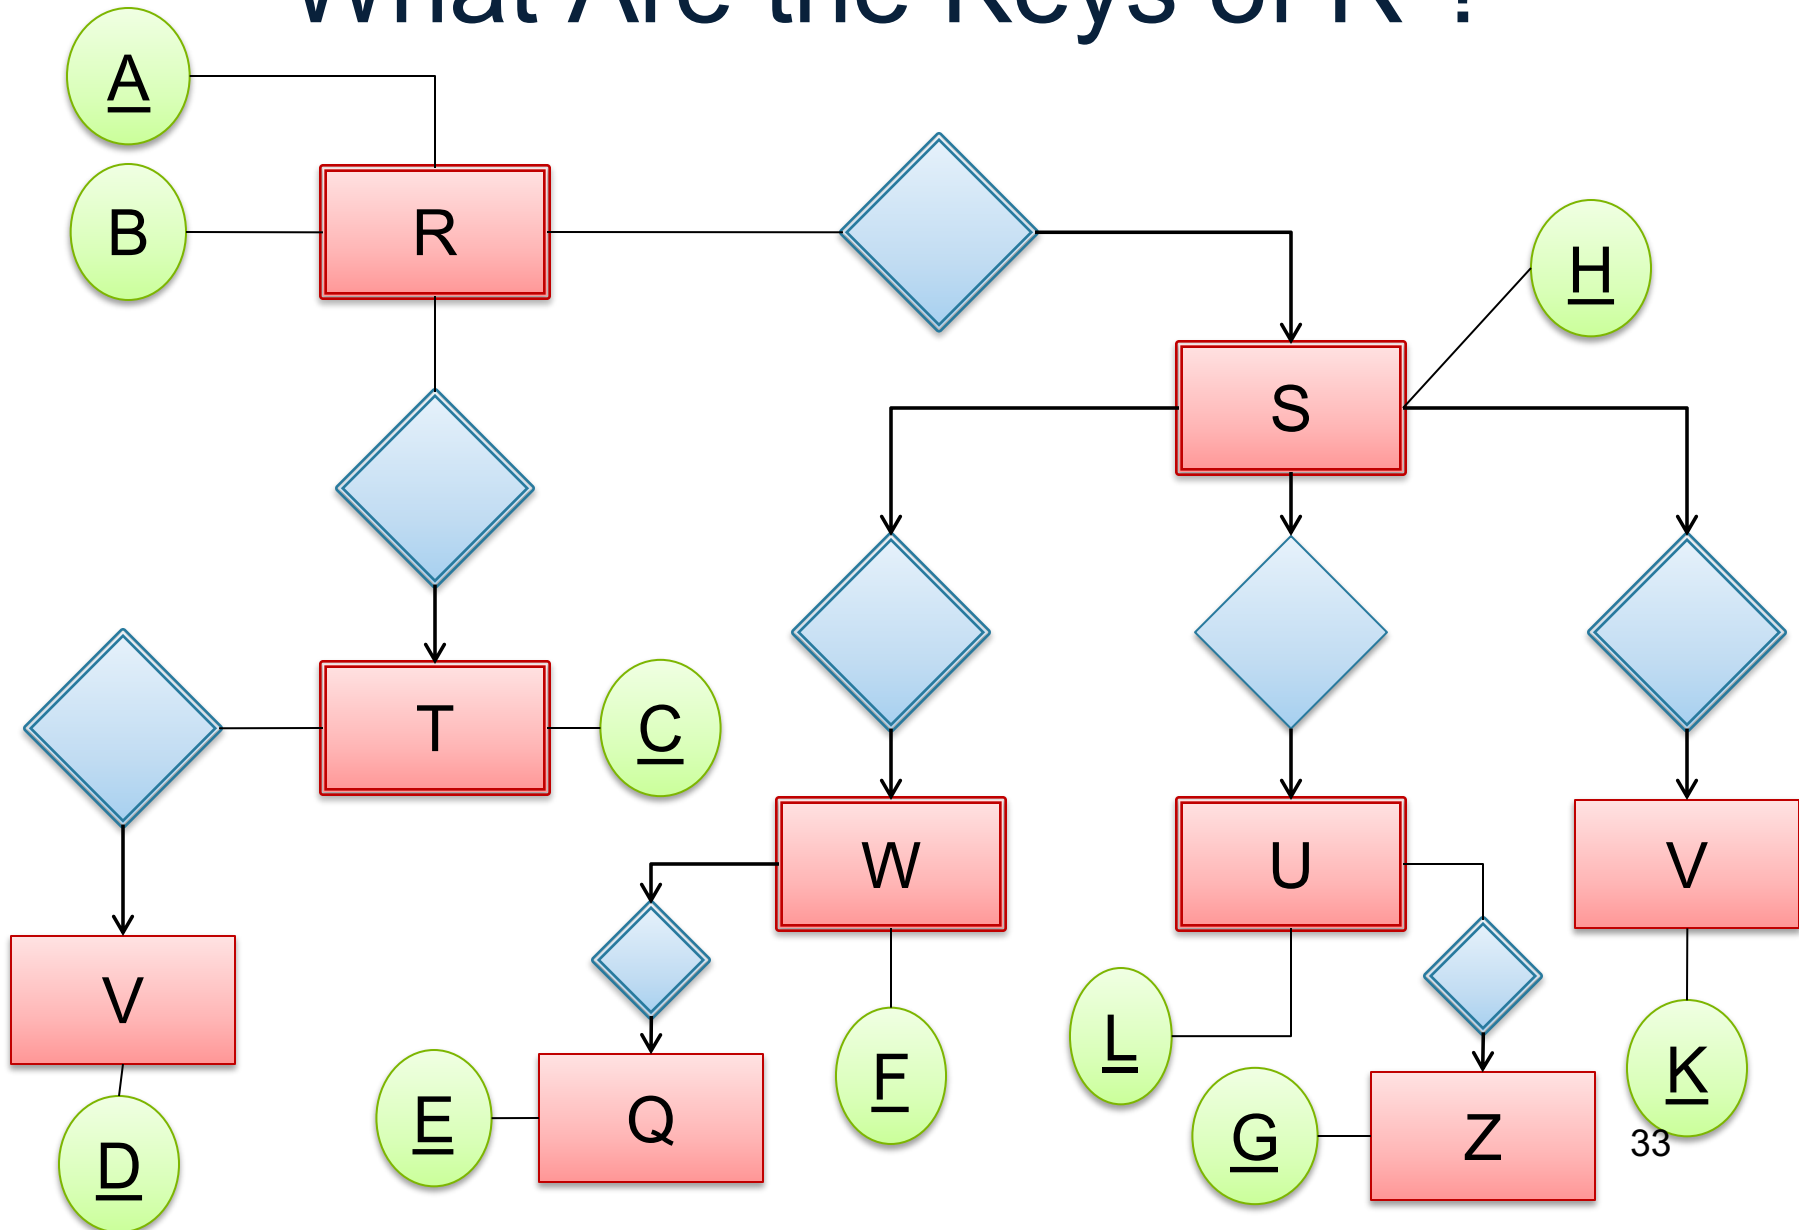

Weak Entity Sets

Entity sets are weak when their key comes from other classes to which they are related.

Team(sport, number, universityName)
University(name)

What Are the Keys of R ?

What makes good schemas?

Integrity Constraints Motivation

An integrity constraint is a condition specified on a database schema that restricts the data that can be stored in an instance of the database.

- ICs help prevent entry of incorrect information
- How? DBMS enforces integrity constraints
 - Allows only legal database instances (i.e., those that satisfy all constraints) to exist
 - Ensures that all necessary checks are always performed and avoids duplicating the verification logic in each application

Constraints in E/R Diagrams

Finding constraints is part of the modeling process.
Commonly used constraints:

Keys: social security number uniquely identifies a person.

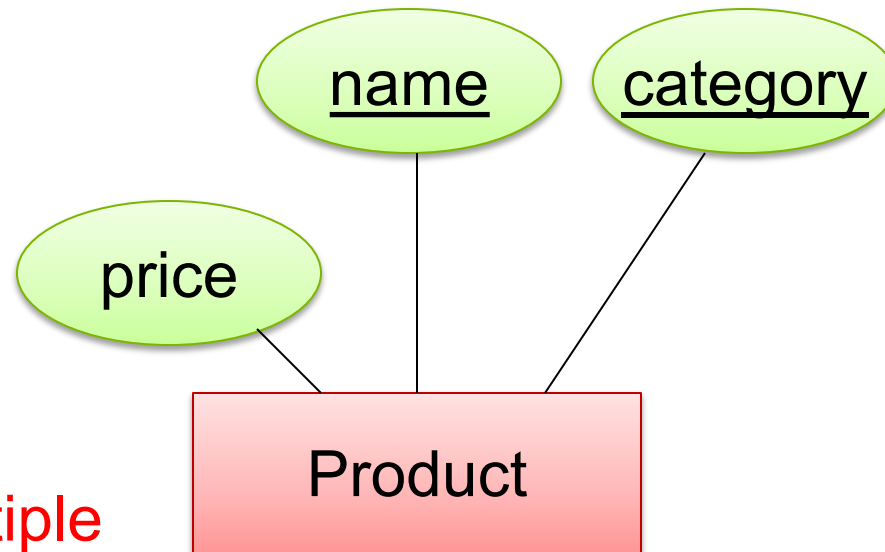

Single-value constraints: a person can have only one father.

Referential integrity constraints: if you work for a company, it must exist in the database.

Other constraints: peoples' ages are between 0 and 150.

Keys in E/R Diagrams

Underline:

No formal way
to specify multiple
keys in E/R diagrams

Single Value Constraints

vs.

Referential Integrity Constraints

Each product made by at most one company.
Some products made by no company

Each product made by exactly one company.

Other Constraints

Q: What does this mean ?

A: A Company entity cannot be connected by relationship to more than 99 Product entities

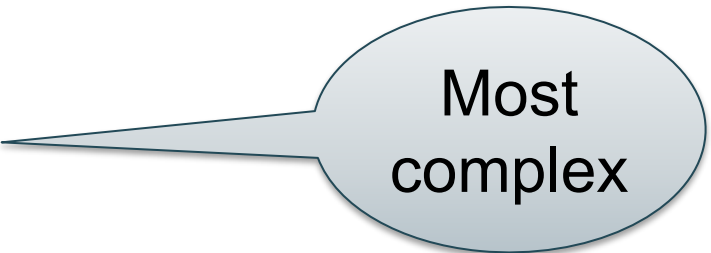

Constraints in SQL

Constraints in SQL:

- Keys, foreign keys
- Attribute-level constraints
- Tuple-level constraints
- Global constraints: assertions

simplest

Most
complex

- The more complex the constraint, the harder it is to check and to enforce

Key Constraints

Product(name, category)

```
CREATE TABLE Product (  
    name CHAR(30) PRIMARY KEY,  
    category VARCHAR(20))
```

OR:

```
CREATE TABLE Product (  
    name CHAR(30),  
    category VARCHAR(20),  
    PRIMARY KEY (name))
```

Keys with Multiple Attributes

Product(name, category, price)

```
CREATE TABLE Product (  
    name CHAR(30),  
    category VARCHAR(20),  
    price INT,  
    PRIMARY KEY (name, category))
```

Name	Category	Price
Gizmo	Gadget	10
Camera	Photo	20
Gizmo	Photo	30
Gizmo	Gadget	40

Other Keys

```
CREATE TABLE Product (  
    productID CHAR(10),  
    name CHAR(30),  
    category VARCHAR(20),  
    price INT,  
    PRIMARY KEY (productID),  
    UNIQUE (name, category))
```

There is at most one **PRIMARY KEY**;
there can be many **UNIQUE**

Foreign Key Constraints

```
CREATE TABLE Purchase (  
  prodName CHAR(30)  
  REFERENCES Product(name),  
  date DATETIME)
```

Referential
integrity
constraints

prodName is a **foreign key** to Product(name)
name must be a **key** in Product

May write
just Product
if name is PK

Foreign Key Constraints

- Example with multi-attribute primary key

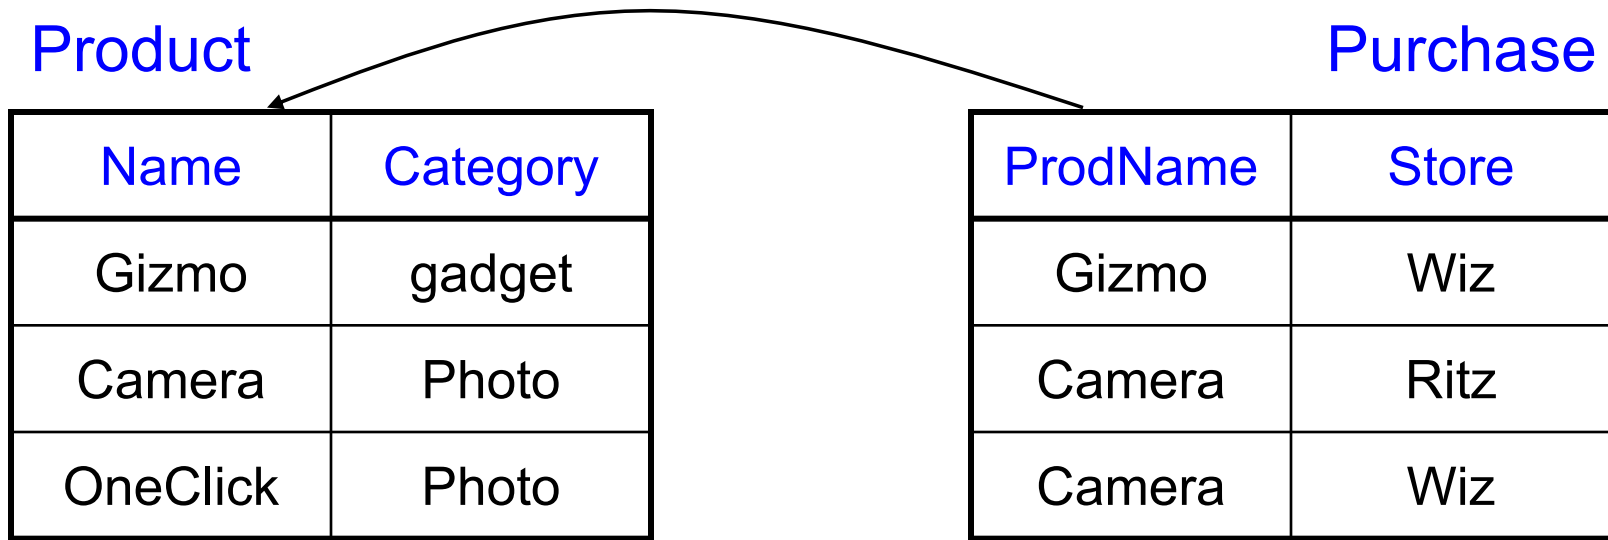

```
CREATE TABLE Purchase (  
    prodName CHAR(30),  
    category VARCHAR(20),  
    date DATETIME,  
    FOREIGN KEY (prodName, category)  
        REFERENCES Product(name, category)
```

- (name, category) must be a KEY in Product

What happens when data changes?

Types of updates:

- In Purchase: insert/update
- In Product: delete/update

What happens when data changes?

- SQL has three policies for maintaining referential integrity:
- NO ACTION reject violating modifications (default)
- CASCADE after delete/update do delete/update
- SET NULL set foreign-key field to NULL
- SET DEFAULT set foreign-key field to default value
 - need to be declared with column, e.g.,
CREATE TABLE Product (pid INT DEFAULT 42)

Maintaining Referential Integrity

```
CREATE TABLE Purchase (  
    prodName CHAR(30),  
    category VARCHAR(20),  
    date DATETIME,  
    FOREIGN KEY (prodName, category)  
    REFERENCES Product(name, category)  
    ON UPDATE CASCADE  
    ON DELETE SET NULL )
```

Product

Name	Category
Gizmo	gadget
Camera	Photo
OneClick	Photo

Purchase

ProdName	Category
Gizmo	Gizmo
Snap	Camera
EasyShoot	Camera

Constraints on Attributes and Tuples

- Constraints on attributes:
 - NOT NULL** -- obvious meaning...
 - CHECK** condition -- any condition !
- Constraints on tuples
 - CHECK** condition

Constraints on Attributes and Tuples

```
CREATE TABLE Product (  
    productID CHAR(10),  
    name CHAR(30),  
    category VARCHAR(20),  
    price INT CHECK (price > 0),  
    PRIMARY KEY (productID))
```

Constraints on Attributes and Tuples

```
CREATE TABLE Product (  
    productID CHAR(10),  
    name CHAR(30),  
    category VARCHAR(20)  
    CHECK (category in ('toy','gadget','apparel')),  
    price INT CHECK (price > 0),  
    PRIMARY KEY (productID))
```

Constraints on Attributes and Tuples

```
CREATE TABLE Product (  
    productID CHAR(10),  
    name CHAR(30) NOT NULL,  
    category VARCHAR(20)  
    CHECK (category in ('toy','gadget','apparel')),  
    price INT CHECK (price > 0),  
    PRIMARY KEY (productID))
```

Constraints on Attributes and Tuples

```
CREATE TABLE R (  
    A int NOT NULL,  
    B int CHECK (B > 50 and B < 100),  
    C varchar(20),  
    D int,  
    CHECK (C >= 'd' or D > 0))
```

Constraints on Attributes and Tuples

What does this constraint do?

```
CREATE TABLE Purchase (  
    prodName CHAR(30)  
    CHECK (prodName IN  
        (SELECT Product.name  
         FROM Product),  
    date DATETIME NOT NULL)
```

What
is the difference from
Foreign-Key ?

General Assertions

```
CREATE ASSERTION myAssert CHECK  
(NOT EXISTS(  
    SELECT Product.name  
    FROM Product, Purchase  
    WHERE Product.name = Purchase.prodName  
    GROUP BY Product.name  
    HAVING count(*) > 200) )
```

But most DBMSs do not implement assertions
Because it is hard to support them efficiently
Instead, they provide triggers

Database Design Process

Conceptual Model:

Relational Model:
Tables + constraints
And also functional dep.

Normalization:
Eliminates anomalies

Conceptual Schema

Physical storage details

Physical Schema

Relational Schema Design

Name	<u>SSN</u>	<u>PhoneNumber</u>	City
Fred	123-45-6789	206-555-1234	Seattle
Fred	123-45-6789	206-555-6543	Seattle
Joe	987-65-4321	908-555-2121	Westfield

One person may have multiple phones, but lives in only one city

Primary key is thus (SSN, PhoneNumber)

What is the problem with this schema?

Relational Schema Design

Name	<u>SSN</u>	<u>PhoneNumber</u>	City
Fred	123-45-6789	206-555-1234	Seattle
Fred	123-45-6789	206-555-6543	Seattle
Joe	987-65-4321	908-555-2121	Westfield

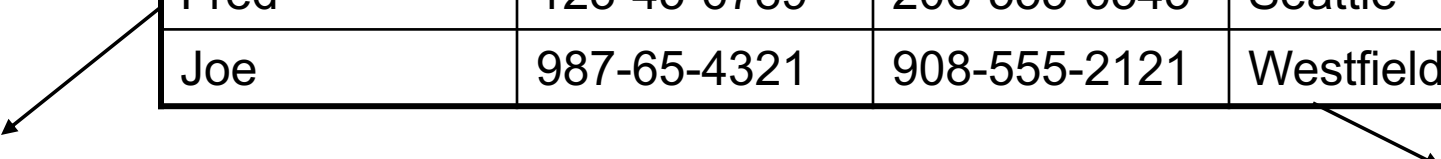

Anomalies:

- Redundancy = repeat data
- Update anomalies = what if Fred moves to “Bellevue”?
- Deletion anomalies = what if Joe deletes his phone number?

Relation Decomposition

Break the relation into two:

Name	SSN	PhoneNumber	City
Fred	123-45-6789	206-555-1234	Seattle
Fred	123-45-6789	206-555-6543	Seattle
Joe	987-65-4321	908-555-2121	Westfield

Name	<u>SSN</u>	City
Fred	123-45-6789	Seattle
Joe	987-65-4321	Westfield

<u>SSN</u>	<u>PhoneNumber</u>
123-45-6789	206-555-1234
123-45-6789	206-555-6543
987-65-4321	908-555-2121

Anomalies have gone:

- No more repeated data
- Easy to move Fred to “Bellevue” (how ?)
- Easy to delete all Joe’s phone numbers (how ?)

Relational Schema Design (or Logical Design)

How do we do this systematically?

- Start with some relational schema
- Find out its **functional dependencies** (FDs)
- Use FDs to **normalize** the relational schema

Functional Dependencies (FDs)

Definition

If two tuples agree on the attributes

A_1, A_2, \dots, A_n

then they must also agree on the attributes

B_1, B_2, \dots, B_m

Formally:

$A_1 \dots A_n$ **determines** $B_1 \dots B_m$

$A_1, A_2, \dots, A_n \rightarrow B_1, B_2, \dots, B_m$

Functional Dependencies (FDs)

Definition $A_1, \dots, A_m \rightarrow B_1, \dots, B_n$ holds in R if:

$\forall t, t' \in R,$

$(t.A_1 = t'.A_1 \wedge \dots \wedge t.A_m = t'.A_m \rightarrow t.B_1 = t'.B_1 \wedge \dots \wedge t.B_n = t'.B_n)$

R		A_1	...	A_m		B_1	...	B_n		
t										
t'										

if t, t' agree here then t, t' agree here

Example

An FD holds, or does not hold on an instance:

EmpID	Name	Phone	Position
E0045	Smith	1234	Clerk
E3542	Mike	9876	Salesrep
E1111	Smith	9876	Salesrep
E9999	Mary	1234	Lawyer

EmpID → Name, Phone, Position

Position → Phone

but not Phone → Position

Example

EmpID	Name	Phone	Position
E0045	Smith	1234	Clerk
E3542	Mike	9876 ←	Salesrep
E1111	Smith	9876 ←	Salesrep
E9999	Mary	1234	Lawyer

Position → Phone

Example

EmpID	Name	Phone	Position
E0045	Smith	1234 →	Clerk
E3542	Mike	9876	Salesrep
E1111	Smith	9876	Salesrep
E9999	Mary	1234 →	Lawyer

But not Phone → Position

Example

name \rightarrow color
category \rightarrow department
color, category \rightarrow price

name	category	color	department	price
Gizmo	Gadget	Green	Toys	49
Tweaker	Gadget	Green	Toys	99

Do all the FDs hold on this instance?

Example

name → color
category → department
color, category → price

name	category	color	department	price
Gizmo	Gadget	Green	Toys	49
Tweaker	Gadget	Green	Toys	49
Gizmo	Stationary	Green	Office-suppl.	59

What about this one ?

Terminology

- FD **holds** or **does not hold** on an instance
- If we can be sure that *every instance of R* will be one in which a given FD is true, then we say that **R satisfies the FD**
- If we say that R satisfies an FD F, we are **stating a constraint on R**

An Interesting Observation

If all these FDs are true:

$\text{name} \rightarrow \text{color}$
 $\text{category} \rightarrow \text{department}$
 $\text{color, category} \rightarrow \text{price}$

Then this FD also holds:

$\text{name, category} \rightarrow \text{price}$

If we find out from application domain that a relation satisfies some FDs, it doesn't mean that we found all the FDs that it satisfies!
There could be more FDs implied by the ones we have.

Closure of a set of Attributes

Given a set of attributes A_1, \dots, A_n

The **closure**, $\{A_1, \dots, A_n\}^+$ = the set of attributes B
s.t. $A_1, \dots, A_n \rightarrow B$

Example:

1. $\text{name} \rightarrow \text{color}$
2. $\text{category} \rightarrow \text{department}$
3. $\text{color, category} \rightarrow \text{price}$

Closures:

$\text{name}^+ = \{\text{name, color}\}$

$\{\text{name, category}\}^+ = \{\text{name, category, color, department, price}\}$

$\text{color}^+ = \{\text{color}\}$

Closure Algorithm

$X = \{A_1, \dots, A_n\}$.

Repeat until X doesn't change do:
if $B_1, \dots, B_n \rightarrow C$ is a FD **and**
 B_1, \dots, B_n are all in X
then add C to X.

Example:

1. name \rightarrow color
2. category \rightarrow department
3. color, category \rightarrow price

$\{\text{name, category}\}^+ =$
 $\{ \text{name, category, color, department, price} \}$

Hence: $\text{name, category} \rightarrow \text{color, department, price}$

Example

In class:

$R(A, B, C, D, E, F)$

A, B	→	C
A, D	→	E
B	→	D
A, F	→	B

Compute $\{A, B\}^+$ $X = \{A, B,$ $\}$

Compute $\{A, F\}^+$ $X = \{A, F,$ $\}$

Example

In class:

$R(A, B, C, D, E, F)$

A, B	→	C
A, D	→	E
B	→	D
A, F	→	B

Compute $\{A, B\}^+$ $X = \{A, B, C, D, E\}$

Compute $\{A, F\}^+$ $X = \{A, F,$ $\}$

Example

In class:

$R(A, B, C, D, E, F)$

A, B	→	C
A, D	→	E
B	→	D
A, F	→	B

Compute $\{A, B\}^+$ $X = \{A, B, C, D, E\}$

Compute $\{A, F\}^+$ $X = \{A, F, B, C, D, E\}$

Example

In class:

$R(A, B, C, D, E, F)$

A, B	→	C
A, D	→	E
B	→	D
A, F	→	B

Compute $\{A, B\}^+$ $X = \{A, B, C, D, E\}$

Compute $\{A, F\}^+$ $X = \{A, F, B, C, D, E\}$

Practice at Home

Find all FD's implied by:

A, B	→	C
A, D	→	B
B	→	D

Practice at Home

Find all FD's implied by:

$$\begin{array}{l} A, B \rightarrow C \\ A, D \rightarrow B \\ B \rightarrow D \end{array}$$

Step 1: Compute X^+ , for every X :

$$A^+ = A, \quad B^+ = BD, \quad C^+ = C, \quad D^+ = D$$

$$\begin{aligned} AB^+ &= ABCD, \quad AC^+ = AC, \quad AD^+ = ABCD, \\ BC^+ &= BCD, \quad BD^+ = BD, \quad CD^+ = CD \end{aligned}$$

$$ABC^+ = ABD^+ = ACD^+ = ABCD \text{ (no need to compute— why ?)}$$

$$BCD^+ = BCD, \quad ABCD^+ = ABCD$$

Step 2: Enumerate all FD's $X \rightarrow Y$, s.t. $Y \subseteq X^+$ and $X \cap Y = \emptyset$:

$$AB \rightarrow CD, \quad AD \rightarrow BC, \quad ABC \rightarrow D, \quad ABD \rightarrow C, \quad ACD \rightarrow B$$

Keys

- A **superkey** is a set of attributes A_1, \dots, A_n s.t. for any other attribute B , we have $A_1, \dots, A_n \rightarrow B$
- A **key** is a minimal superkey
 - A superkey and for which no subset is a superkey

Computing (Super)Keys

- For all sets X , compute X^+
- If $X^+ = [\text{all attributes}]$, then X is a superkey
- Try only the minimal X 's to get the key

Example

Product(name, price, category, color)

name, category → price
category → color

What is the key ?

Example

Product(name, price, category, color)

name, category \rightarrow price
category \rightarrow color

What is the key ?

$(\text{name, category}) + = \{ \text{name, category, price, color} \}$

Hence (name, category) is a key

Key or Keys ?

Can we have more than one key ?

Given $R(A,B,C)$ define FD's s.t. there are two or more keys

$A \rightarrow B$
 $B \rightarrow C$
 $C \rightarrow A$

or

$AB \rightarrow C$
 $BC \rightarrow A$

or

$A \rightarrow BC$
 $B \rightarrow AC$

what are the keys here ?

Eliminating Anomalies

Main idea:

- $X \rightarrow A$ is OK if X is a (super)key
- $X \rightarrow A$ is not OK otherwise
 - Need to decompose the table, but how?

Boyce-Codd Normal Form

Boyce-Codd Normal Form

Dr. Raymond F. Boyce

Boyce-Codd Normal Form

There are no
“bad” FDs:

Definition. A relation R is in BCNF if:

Whenever $X \rightarrow B$ is a non-trivial dependency,
then X is a superkey.

Equivalently:

Definition. A relation R is in BCNF if:

$\forall X$, either $X^+ = X$ or $X^+ = [\text{all attributes}]$

BCNF Decomposition Algorithm

Normalize(R)

find X s.t.: $X \neq X^+$ and $X^+ \neq [\text{all attributes}]$

if (not found) **then** “R is in BCNF”

let $Y = X^+ - X$; $Z = [\text{all attributes}] - X^+$

decompose R into $R_1(X \cup Y)$ and $R_2(X \cup Z)$

Normalize(R_1); Normalize(R_2);

Example

Name	SSN	PhoneNumber	City
Fred	123-45-6789	206-555-1234	Seattle
Fred	123-45-6789	206-555-6543	Seattle
Joe	987-65-4321	908-555-2121	Westfield
Joe	987-65-4321	908-555-1234	Westfield

$SSN \rightarrow Name, City$

The only key is: $\{SSN, PhoneNumber\}$

Hence $SSN \rightarrow Name, City$ is a “bad” dependency

In other words:

$SSN^+ = SSN, Name, City$ and is neither SSN nor All Attributes

Example BCNF Decomposition

Name	<u>SSN</u>	City
Fred	123-45-6789	Seattle
Joe	987-65-4321	Westfield

$SSN \rightarrow Name, City$

<u>SSN</u>	<u>PhoneNumber</u>
123-45-6789	206-555-1234
123-45-6789	206-555-6543
987-65-4321	908-555-2121
987-65-4321	908-555-1234

Let's check anomalies:

- Redundancy ?
- Update ?
- Delete ?

Find X s.t.: $X \neq X^+$ and $X^+ \neq [\text{all attributes}]$

Example BCNF Decomposition

Person(name, SSN, age, hairColor, phoneNumber)

SSN \rightarrow name, age

age \rightarrow hairColor

Find X s.t.: $X \neq X^+$ and $X^+ \neq [\text{all attributes}]$

Example BCNF Decomposition

Person(name, SSN, age, hairColor, phoneNumber)

SSN \rightarrow name, age

age \rightarrow hairColor

Iteration 1: **Person**: SSN⁺ = SSN, name, age, hairColor

Decompose into: **P(SSN, name, age, hairColor)**

Phone(SSN, phoneNumber)

Find X s.t.: $X \neq X^+$ and $X^+ \neq [\text{all attributes}]$

Example BCNF Decomposition

Person(name, SSN, age, hairColor, phoneNumber)

SSN \rightarrow name, age

age \rightarrow hairColor

What are
the keys ?

Iteration 1: **Person**: SSN⁺ = SSN, name, age, hairColor

Decompose into: **P**(SSN, name, age, hairColor)

Phone(SSN, phoneNumber)

Iteration 2: **P**: age⁺ = age, hairColor

Decompose: **People**(SSN, name, age)

Hair(age, hairColor)

Phone(SSN, phoneNumber)

Find X s.t.: $X \neq X^+$ and $X^+ \neq [\text{all attributes}]$

Example BCNF Decomposition

Person(name, SSN, age, hairColor, phoneNumber)

SSN \rightarrow name, age

age \rightarrow hairColor

Note the keys!

Iteration 1: **Person**: SSN⁺ = SSN, name, age, hairColor

Decompose into: **P**(SSN, name, age, hairColor)

Phone(SSN, phoneNumber)

Iteration 2: **P**: age⁺ = age, hairColor

Decompose: **People**(SSN, name, age)

Hair(age, hairColor)

Phone(SSN, phoneNumber)

$R(A,B,C,D)$

Example: BCNF

$A \rightarrow B$
$B \rightarrow C$

$R(A,B,C,D)$

$A \rightarrow B$
 $B \rightarrow C$

Example: BCNF

Recall: find X s.t.
 $X \subsetneq X^+ \subsetneq [\text{all-attrs}]$

$R(A,B,C,D)$

$R(A,B,C,D)$

$A \rightarrow B$
$B \rightarrow C$

Example: BCNF

$R(A,B,C,D)$
 $A^+ = ABC \neq ABCD$

$R(A,B,C,D)$

$A \rightarrow B$
 $B \rightarrow C$

Example: BCNF

$R(A,B,C,D)$

$A \rightarrow B$
$B \rightarrow C$

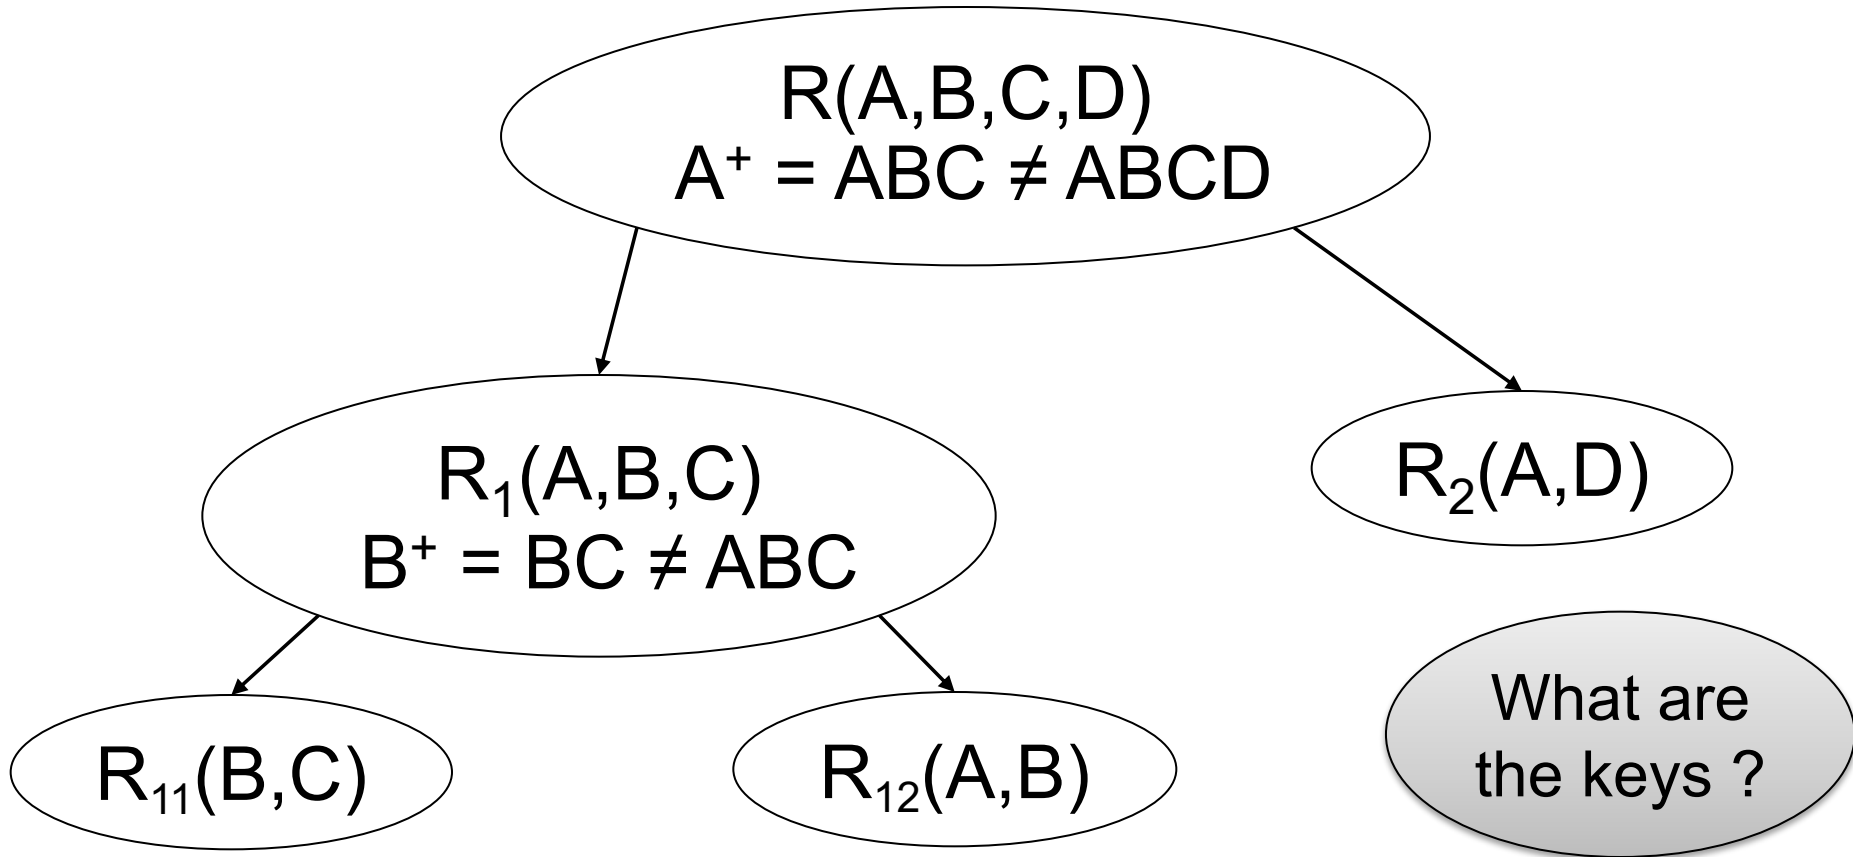

Example: BCNF

$R(A,B,C,D)$

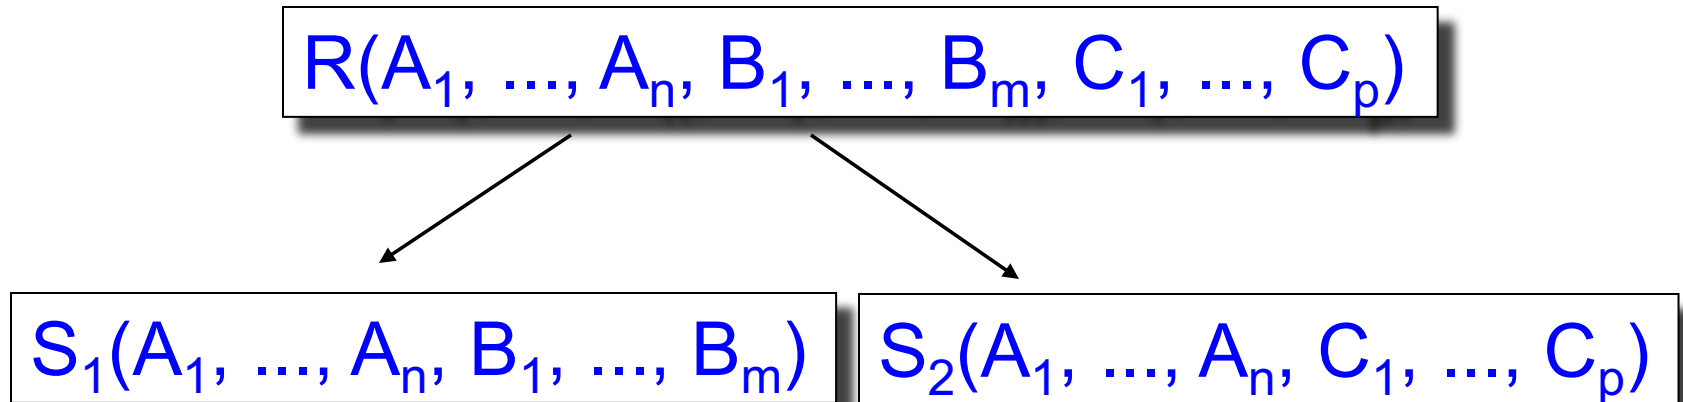

$A \rightarrow B$
 $B \rightarrow C$

Example: BCNF

What happens if in R we first pick B^+ ? Or AB^+ ?

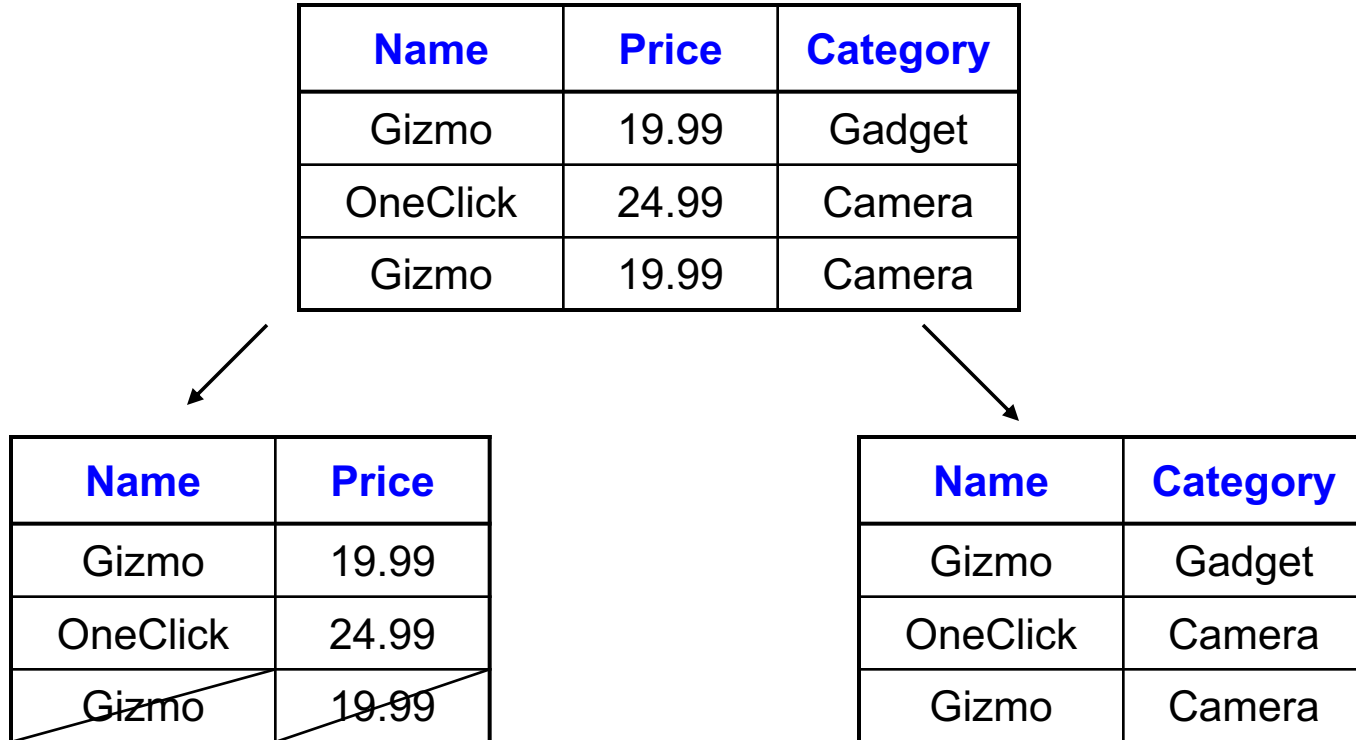

Decompositions in General

S_1 = projection of R on $A_1, \dots, A_n, B_1, \dots, B_m$

S_2 = projection of R on $A_1, \dots, A_n, C_1, \dots, C_p$

Lossless Decomposition

Lossy Decomposition

What is
lossy here?

Name	Price	Category

Decomposition in General

Let: S_1 = projection of R on $A_1, \dots, A_n, B_1, \dots, B_m$

S_2 = projection of R on $A_1, \dots, A_n, C_1, \dots, C_p$

The decomposition is called lossless if $R = S_1 \bowtie S_2$

Fact: If $A_1, \dots, A_n \rightarrow B_1, \dots, B_m$ then the decomposition is lossless

It follows that every BCNF decomposition is lossless

The Chase Test for Lossless Join

$R(A,B,C,D) = S1(A,D) \bowtie S2(A,C) \bowtie S3(B,C,D)$

R satisfies: $A \rightarrow B$, $B \rightarrow C$, $CD \rightarrow A$

$S1 = \Pi_{AD}(R)$, $S2 = \Pi_{AC}(R)$, $S3 = \Pi_{BCD}(R)$,

hence $R \subseteq S1 \bowtie S2 \bowtie S3$

Need to check: $R \supseteq S1 \bowtie S2 \bowtie S3$

The Chase Test for Lossless Join

$R(A,B,C,D) = S1(A,D) \bowtie S2(A,C) \bowtie S3(B,C,D)$

R satisfies: $A \rightarrow B$, $B \rightarrow C$, $CD \rightarrow A$

$S1 = \Pi_{AD}(R)$, $S2 = \Pi_{AC}(R)$, $S3 = \Pi_{BCD}(R)$,

hence $R \subseteq S1 \bowtie S2 \bowtie S3$

Need to check: $R \supseteq S1 \bowtie S2 \bowtie S3$

Suppose $(a,b,c,d) \in S1 \bowtie S2 \bowtie S3$ Is it also in R?

R must contain the following tuples:

A	B	C	D
a	b1	c1	d

Why ?

$(a,d) \in S1 = \Pi_{AD}(R)$

The Chase Test for Lossless Join

$R(A,B,C,D) = S1(A,D) \bowtie S2(A,C) \bowtie S3(B,C,D)$

R satisfies: $A \rightarrow B$, $B \rightarrow C$, $CD \rightarrow A$

$S1 = \Pi_{AD}(R)$, $S2 = \Pi_{AC}(R)$, $S3 = \Pi_{BCD}(R)$,

hence $R \subseteq S1 \bowtie S2 \bowtie S3$

Need to check: $R \supseteq S1 \bowtie S2 \bowtie S3$

Suppose $(a,b,c,d) \in S1 \bowtie S2 \bowtie S3$ Is it also in R?

R must contain the following tuples:

A	B	C	D
a	b1	c1	d
a	b2	c	d2

Why ?

$(a,d) \in S1 = \Pi_{AD}(R)$

$(a,c) \in S2 = \Pi_{AC}(R)$

The Chase Test for Lossless Join

$R(A,B,C,D) = S1(A,D) \bowtie S2(A,C) \bowtie S3(B,C,D)$

R satisfies: $A \rightarrow B$, $B \rightarrow C$, $CD \rightarrow A$

$S1 = \Pi_{AD}(R)$, $S2 = \Pi_{AC}(R)$, $S3 = \Pi_{BCD}(R)$,

hence $R \subseteq S1 \bowtie S2 \bowtie S3$

Need to check: $R \supseteq S1 \bowtie S2 \bowtie S3$

Suppose $(a,b,c,d) \in S1 \bowtie S2 \bowtie S3$ Is it also in R?

R must contain the following tuples:

A	B	C	D
a	b1	c1	d
a	b2	c	d2
a3	b	c	d

Why ?

$(a,d) \in S1 = \Pi_{AD}(R)$

$(a,c) \in S2 = \Pi_{AC}(R)$

$(b,c,d) \in S3 = \Pi_{BCD}(R)$

The Chase Test for Lossless Join

$R(A,B,C,D) = S1(A,D) \bowtie S2(A,C) \bowtie S3(B,C,D)$
R satisfies: $A \rightarrow B$, $B \rightarrow C$, $CD \rightarrow A$

$S1 = \Pi_{AD}(R)$, $S2 = \Pi_{AC}(R)$, $S3 = \Pi_{BCD}(R)$,

hence $R \subseteq S1 \bowtie S2 \bowtie S3$

Need to check: $R \supseteq S1 \bowtie S2 \bowtie S3$

Suppose $(a,b,c,d) \in S1 \bowtie S2 \bowtie S3$ Is it also in R?

R must contain the following tuples:

A	B	C	D
a	b1	c1	d
a	b2	c	d2
a3	b	c	d

Why ?

$(a,d) \in S1 = \Pi_{AD}(R)$

$(a,c) \in S2 = \Pi_{AC}(R)$

$(b,c,d) \in S3 = \Pi_{BCD}(R)$

“Chase” them (apply FDs):

$A \rightarrow B$

A	B	C	D
a	b1	c1	d
a	b1	c	d2
a3	b	c	d

The Chase Test for Lossless Join

$R(A,B,C,D) = S1(A,D) \bowtie S2(A,C) \bowtie S3(B,C,D)$

R satisfies: $A \rightarrow B$, $B \rightarrow C$, $CD \rightarrow A$

$S1 = \Pi_{AD}(R)$, $S2 = \Pi_{AC}(R)$, $S3 = \Pi_{BCD}(R)$,

hence $R \subseteq S1 \bowtie S2 \bowtie S3$

Need to check: $R \supseteq S1 \bowtie S2 \bowtie S3$

Suppose $(a,b,c,d) \in S1 \bowtie S2 \bowtie S3$ Is it also in R?

R must contain the following tuples:

A	B	C	D
a	b1	c1	d
a	b2	c	d2
a3	b	c	d

Why ?

$(a,d) \in S1 = \Pi_{AD}(R)$

$(a,c) \in S2 = \Pi_{AC}(R)$

$(b,c,d) \in S3 = \Pi_{BCD}(R)$

“Chase” them (apply FDs):

$A \rightarrow B$

A	B	C	D
a	b1	c1	d
a	b1	c	d2
a3	b	c	d

$B \rightarrow C$

A	B	C	D
a	b1	c	d
a	b1	c	d2
a3	b	c	d

The Chase Test for Lossless Join

$$R(A,B,C,D) = S1(A,D) \bowtie S2(A,C) \bowtie S3(B,C,D)$$
$$R \text{ satisfies: } A \rightarrow B, B \rightarrow C, CD \rightarrow A$$

$S1 = \Pi_{AD}(R)$, $S2 = \Pi_{AC}(R)$, $S3 = \Pi_{BCD}(R)$,
hence $R \subseteq S1 \bowtie S2 \bowtie S3$

Need to check: $R \supseteq S1 \bowtie S2 \bowtie S3$

Suppose $(a,b,c,d) \in S1 \bowtie S2 \bowtie S3$ Is it also in R ?

R must contain the following tuples:

A	B	C	D
a	b1	c1	d
a	b2	c	d2
a3	b	c	d

Why ?
 $(a,d) \in S1 = \Pi_{AD}(R)$
 $(a,c) \in S2 = \Pi_{AC}(R)$
 $(b,c,d) \in S3 = \Pi_{BCD}(R)$

“Chase” them (apply FDs):

$A \rightarrow B$

A	B	C	D
a	b1	c1	d
a	b1	c	d2
a3	b	c	d

$B \rightarrow C$

A	B	C	D
a	b1	c	d
a	b1	c	d2
a3	b	c	d

$CD \rightarrow A$

A	B	C	D
a	b1	c	d
a	b1	c	d2
a	b	c	d

Hence R
contains (a,b,c,d)

Schema Refinements = Normal Forms

- 1st Normal Form = all tables are flat
- 2nd Normal Form = obsolete
- Boyce Codd Normal Form = no bad FDs
- 3rd Normal Form = see book
 - BCNF is lossless but can cause loss of ability to check some FDs (see book 3.4.4)
 - 3NF fixes that (is lossless and dependency-preserving), but some tables might not be in BCNF – i.e., they may have redundancy anomalies
