Group By

- Powerful tool to handle “categories”
  - Treat rows with a same attribute as a category
- Careful when selecting
  - Only select attributes appeared in **GROUP BY or aggregates**
  - SQLite will guess (arbitrarily pick a value)¯_(ツ)_/¯
  - SQL Server will throw an error ง'̀-'́)ง

Group By - Examples

Do these queries work?

Enrolled(stu_id, course_num)

johndoe	311
johndoe	344
maryjane	311
maryjane	351
maryjane	369

```
SELECT stu_id, course_num
  FROM Enrolled
 GROUP BY stu_id
```

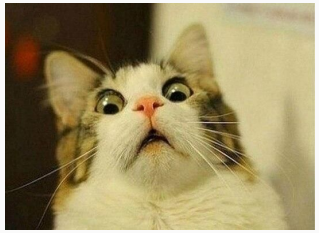
```
SELECT stu_id, count(course_num)
  FROM Enrolled
 GROUP BY stu_id
```

Group By - Examples

Do these queries work?

Enrolled(stu_id, course_num)

johndoe	?
maryjane	?



```
SELECT stu_id, course_num
  FROM Enrolled
 GROUP BY stu_id
```

```
SELECT stu_id, count(course_num)
  FROM Enrolled
 GROUP BY stu_id
```

Group By - Examples

Do these queries work?

Enrolled(stu_id, course_num)

johndoe	2
maryjane	3

```
SELECT stu_id, course_num
  FROM Enrolled
 GROUP BY stu_id
```

```
SELECT stu_id, count(course_num)
  FROM Enrolled
 GROUP BY stu_id
```

Group By - Examples

What happens when we try to do:

```
SELECT attr_1, attr_2, …, attr_n
FROM …
GROUP BY attr_1, attr_2, …, attr_n;
```

Group By - Examples

What happens when we try to do:

```
SELECT attr_1, attr_2, …, attr_n
FROM …
GROUP BY attr_1, attr_2, …, attr_n;
```

This is like `SELECT DISTINCT...`

Witnessing (i.e. argmax)

Find the student who is taking the most classes.

```
Student(stu_id, id_num)
Enrolled(id_num, class)
```

johndoe	973
maryjane	712
alsmith	899

973	CSE 311
973	CSE 344
712	CSE 311
899	CSE 351

```
SELECT S.stu_id
  FROM Student S, Enrolled E
 WHERE S.id_num = E.id_num
 GROUP BY S.stu_id
HAVING COUNT(E.class) >= ALL(
            SELECT COUNT(E1.class)
              FROM Enrolled E1
             GROUP BY E1.id_num);
```

Nested Queries

- Avoid when possible
- Danger of making simple queries slow and complicated
- Just because you can do it, doesn’t mean you should

Subquery in SELECT

```
SELECT DISTINCT C.cname, (SELECT count(*)
                            FROM Product P
                           WHERE P.cid=C.cid)
  FROM Company C
```

Subquery in SELECT

Unnest using `JOIN` and `GROUP BY`

```
SELECT C.cname, COUNT(P.cid)
FROM Company C
LEFT OUTER JOIN Product ON C.cid = P.cid
GROUP BY C.cname;
```

Subquery in FROM

```
SELECT X.pname
  FROM (SELECT *
          FROM Product
         WHERE price > 20) AS X
 WHERE X.price < 500
```

More readable: `WITH <name> AS <subquery>`

Subquery in FROM

Unnest using `WHERE`

```
SELECT X.pname
  FROM Product AS X
 WHERE X.price < 500 AND X.price > 20;
```

Subquery in WHERE

```
SELECT DISTINCT C.cname
  FROM Company C
 WHERE EXISTS (SELECT *
                 FROM Product P
                WHERE C.cid = P.cid AND P.price < 200)
```

Subquery in WHERE

```
SELECT DISTINCT C.cname
  FROM Company C, Product P
 WHERE C.cid = P.cid AND P.price < 200
```

Subquery in WHERE Syntax

- `SELECT ..... WHERE EXISTS (sub);`
- `SELECT ..... WHERE NOT EXISTS (sub);`
- `SELECT ..... WHERE attribute IN (sub);`
- `SELECT ..... WHERE attribute NOT IN (sub);`
- `SELECT ..... WHERE attribute > ANY (sub);`
- `SELECT ..... WHERE attribute > ALL (sub);`

(Non-)monotonic Queries

- “Can we take back outputs by looking at more data?”
- Is this a monotonic query?

```
SELECT count(*)
  FROM T1
 GROUP BY T1.attr
```

(Non-)monotonic Queries

- “Can we take back outputs by looking at more data?”
- Is this a monotonic query?

```
SELECT count(*)
  FROM T1
 GROUP BY T1.attr
```

No! This query does not satisfy **set containment**.

Ex:
Current output: {(6), (23), (10)}
After more data: {(6), (23), (11)}

{(6), (23), (10)} ⊄ {(6), (23), (11)}

To Nest or Not to Nest

- Not an exact science
- Figuring out what is actually wanted will help you find simpler solutions (best way is to practice)
- Trigger words to use sub-querying
  - Every, All (universal quantifiers)
  - No, None, Never (negation)
  - Only
