

CSE P 501 – Compilers

LR Parser Construction
Hal Perkins
Summer 2004

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-1

Agenda

- LR(0) state construction
- FIRST, FOLLOW, and nullable
- Variations SLR, LR(1), LALR

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-2

LR State Machine

- Idea: Build a DFA that recognizes handles
 - Language generated by a CFG is generally not regular, but
 - Language of handles for a CFG is regular
 - So a DFA can be used to recognize handles
 - Parser reduces when DFA accepts

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-3

Prefixes, Handles, &c (review)

- If S is the start symbol of a grammar G ,
 - If $S \Rightarrow^* \alpha$ then α is a *sentential form* of G
 - γ is a *viable prefix* of G if there is some derivation $S \Rightarrow_{\text{rm}}^* \alpha A W \Rightarrow_{\text{rm}}^* \alpha \beta W$ and γ is a prefix of $\alpha \beta$.
 - The occurrence of β in $\alpha \beta W$ is a *handle* of $\alpha \beta W$
- An *item* is a marked production (a . at some position in the right hand side)
 - $[A ::= . X Y]$ $[A ::= X . Y]$ $[A ::= X Y .]$

E-4

Building the LR(0) States

- Example grammar
 - $S' ::= S \$$
 - $S ::= (L)$
 - $S ::= x$
 - $L ::= S$
 - $L ::= L , S$
- We add a production S' with the original start symbol followed by end of file ($\$$)
- Question: What language does this grammar generate?

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-5

Start of LR Parse

- Initially
 - Stack is empty
 - Input is the right hand side of S' , i.e., $S \$$
 - Initial configuration is $[S' ::= . S \$]$
 - But, since position is just before S , we are also just before anything that can be derived from S

$S' ::= S \$$
 $S ::= (L)$
 $S ::= x$
 $L ::= S$
 $L ::= L , S$

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-6

$S' ::= S \$$
 $S ::= (L)$
 $S ::= x$
 $L ::= S$
 $L ::= L, S$

Initial state

$S' ::= . S \$$
 $S ::= . (L)$
 $S ::= . x$

start → $S' ::= . S \$$
 completion → $S ::= . (L)$
 completion → $S ::= . x$

- A state is just a set of items
 - Start: an initial set of items
 - Completion (or closure): additional productions whose left hand side appears to the right of the dot in some item already in the state

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-7

$S' ::= S \$$
 $S ::= (L)$
 $S ::= x$
 $L ::= S$
 $L ::= L, S$

Shift Actions (1)

$S' ::= . S \$$
 $S ::= . (L)$
 $S ::= . x$

 \xrightarrow{x}

$S ::= x .$

- To shift past the x , add a new state with the appropriate item(s)
 - In this case, a single item; the closure adds nothing
 - This state will lead to a reduction since no further shift is possible

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-8

$S' ::= S \$$
 $S ::= (L)$
 $S ::= x$
 $L ::= S$
 $L ::= L, S$

Shift Actions (2)

$S' ::= . S \$$
 $S ::= . (L)$
 $S ::= . x$

 $\xrightarrow{(}$

$S ::= (. L)$
 $L ::= . L, S$
 $L ::= . S$
 $S ::= . (L)$
 $S ::= . x$

- If we shift past the $($, we are at the beginning of L
- the closure adds all productions that start with L , which requires adding all productions starting with S

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-9

$S' ::= S \$$
 $S ::= (L)$
 $S ::= x$
 $L ::= S$
 $L ::= L, S$

Goto Actions

$S' ::= . S \$$
 $S ::= . (L)$
 $S ::= . x$

 \xrightarrow{S}

$S' ::= S . \$$

- Once we reduce S , we'll pop the rhs from the stack exposing the first state. Add a *goto* transition on S for this.

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-10

Basic Operations

- Closure (S)**
 - Adds all items implied by items already in S
- Goto (I, X)**
 - I is a set of items
 - X is a grammar symbol (terminal or non-terminal)
 - Goto** moves the dot past the symbol X in all appropriate items in set I

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-11

Closure Algorithm

- Closure (S) =**
 - repeat
 - for any item $[A ::= \alpha . X \beta]$ in S
 - for all productions $X ::= \gamma$
 - add $[X ::= . \gamma]$ to S
 - until S does not change
 - return S

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-12

Goto Algorithm

- $Goto(I, X) =$
 - set new to the empty set
 - for each item $[A ::= \alpha . X \beta]$ in I
 - add $[A ::= \alpha X . \beta]$ to new
 - return $Closure(new)$
- This may create a new state, or may return an existing one

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-13

LR(0) Construction

- First, augment the grammar with an extra start production $S' ::= S \$$
- Let T be the set of states
- Let E be the set of edges
- Initialize T to $Closure([S' ::= . S \$])$
- Initialize E to empty

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-14

LR(0) Construction Algorithm

- repeat
- for each state I in T
 - for each item $[A ::= \alpha . X \beta]$ in I
 - Let new be $Goto(I, X)$
 - Add new to T if not present
 - Add $I \xrightarrow{X} new$ to E if not present
- until E and T do not change in this iteration
- Footnote: For symbol $\$,$ we don't compute $goto(I, \$)$; instead, we make this an *accept* action.

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-15

LR(0) Reduce Actions

- Algorithm:
 - Initialize R to empty
 - for each state I in T
 - for each item $[A ::= \alpha .]$ in I
 - add $(I, A ::= \alpha)$ to R

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-16

Building the Parse Tables (1)

- For each edge $I \xrightarrow{X} J$
 - if X is a terminal, put s_j in column X , row I of the action table (shift to state j)
 - If X is a non-terminal, put g_j in column X , row I of the goto table

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-17

Building the Parse Tables (2)

- For each state I containing an item $[S' ::= S . \$]$, put *accept* in column $\$$ of row I
- Finally, for any state containing $[A ::= \gamma .]$ put action r_n in every column of row n in the table, where n is the production number

6/29/2004

E-18

Example: States for

$S' ::= S \$$
 $S ::= (L)$
 $S ::= x$
 $L ::= S$
 $L ::= L, S$

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-19

Example: Tables for

$S' ::= S \$$
 $S ::= (L)$
 $S ::= x$
 $L ::= S$
 $L ::= L, S$

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-20

Where Do We Stand?

- We have built the LR(0) state machine and parser tables
 - No lookahead yet
 - Different variations of LR parsers add lookahead information, but basic idea of states, closures, and edges remains the same

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-21

A Grammar that is not LR(0)

- Build the state machine and parse tables for a simple expression grammar

$$S ::= E \$$$

$$E ::= T + E$$

$$E ::= T$$

$$T ::= x$$

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-22

LR(0) Parser for

0. $S ::= E \$$
 1. $E ::= T + E$
 2. $E ::= T$
 3. $T ::= x$

State 1: $S ::= \cdot E \$$
 State 2: $S ::= E \cdot \$$
 State 3: $E ::= \cdot T + E$
 State 4: $E ::= T \cdot$
 State 5: $T ::= \cdot x$
 State 6: $E ::= T + \cdot E$

	x	+	\$	E	T
1	s5			acc	G3
2					
3	r2	s4, r2	r2		
4	s5			g6	G3
5	r3	r3	r3		
6	r1	r1	r1		

- State 3 is has two possible actions on +
 - shift 4, or reduce 2
- ∴ Grammar is not LR(0)

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-23

SLR Parsers

- Idea: Use information about what can follow a non-terminal to decide if we should perform a reduction
- Easiest form is SLR – Simple LR
- So we need to be able to compute FOLLOW(A) – the set of symbols that can follow A in any possible derivation
 - But to do this, we need to compute FIRST(γ) for strings γ that can follow A

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-24

Calculating FIRST(γ)

- Sounds easy... If $\gamma = XYZ$, then FIRST(γ) is FIRST(X), right?
- But what if we have the rule $X ::= \epsilon$?
- In that case, FIRST(γ) includes anything that can follow an X – i.e. FOLLOW(X)

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-25

FIRST, FOLLOW, and nullable

- nullable(X) is true if X can derive the empty string
- Given a string γ of terminals and non-terminals, FIRST(γ) is the set of terminals that can begin strings derived from γ .
- FOLLOW(X) is the set of terminals that can immediately follow X in some derivation
- All three of these are computed together

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-26

Computing FIRST, FOLLOW, and nullable (1)

- Initialization
 - set FIRST and FOLLOW to be empty sets
 - set nullable to false for all non-terminals
 - set FIRST[a] to a for all terminal symbols a

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-27

Computing FIRST, FOLLOW, and nullable (2)

```

repeat
  for each production  $X ::= Y_1 Y_2 \dots Y_k$ 
    if  $Y_1 \dots Y_k$  are all nullable (or if  $k = 0$ )
      set nullable[ $X$ ] = true
    for each  $i$  from 1 to  $k$  and each  $j$  from  $i+1$  to  $k$ 
      if  $Y_1 \dots Y_{i-1}$  are all nullable (or if  $i = 1$ )
        add FIRST[ $Y_i$ ] to FIRST[ $X$ ]
      if  $Y_{i+1} \dots Y_k$  are all nullable (or if  $i = k$ )
        add FOLLOW[ $X$ ] to FOLLOW[ $Y_i$ ]
      if  $Y_{i+1} \dots Y_{j-1}$  are all nullable (or if  $i+1=j$ )
        add FIRST[ $Y_j$ ] to FOLLOW[ $Y_i$ ]
Until FIRST, FOLLOW, and nullable do not change
    
```

6/29/2004

© 2002-04 Hal Perkins & UW CSE

E-28

Example

Grammar	nullable	FIRST	FOLLOW
$Z ::= d$		x	
$Z ::= XYZ$			
$Y ::= \epsilon$		y	
$Y ::= c$			
$X ::= Y$			
$X ::= a$		z	

6/29/2004

E-29

SLR Construction

- This is identical to LR(0) – states, etc., except for the calculation of reduce actions
- Algorithm:
 - Initialize R to empty
 - for each state I in \mathcal{T}
 - for each item $[A ::= \alpha \cdot]$ in I
 - for each terminal a in FOLLOW(A)
 - add $(I, a, A ::= \alpha)$ to R
 - i.e., reduce α to A in state I only on lookahead a

6/29/2004

E-30

SLR Parser for

0. $S ::= E \$$
1. $E ::= T + E$
2. $E ::= T$
3. $T ::= x$

	x	+	\$	E	T
1	s5			g2	g3
2		acc			
3	r2	s4, r2	r2		
4	s5			g6	g3
5	r3	r3	r3		
6	r1	r1	r1		

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-31

On To LR(1)

- Many practical grammars are SLR
- LR(1) is more powerful yet
- Similar construction, but notion of an item is more complex, incorporating lookahead information

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-32

LR(1) Items

- An LR(1) item $[A ::= \alpha . \beta, a]$ is
 - A grammar production ($A ::= \alpha\beta$)
 - A right hand side position (the dot)
 - A lookahead symbol (a)
- Idea: This item indicates that α is the top of the stack and the next input is derivable from βa .
- Full construction: see the book

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-33

LR(1) Tradeoffs

- LR(1)
 - Pro: extremely precise; largest set of grammars
 - Con: potentially very large parse tables with many states

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-34

LALR(1)

- Variation of LR(1), but merge any two states that differ only in lookahead
 - Example: these two would be merged
 - $[A ::= x ., a]$
 - $[A ::= x ., b]$

6/29/2004 © 2002-04 Hal Perkins & UW CSE E-35

LALR(1) vs LR(1)

- LALR(1) tables can have many fewer states than LR(1)
- LALR(1) may have reduce conflicts where LR(1) would not (but in practice this doesn't happen often)
