

# CSE P 501 – Compilers

LR Parser Construction  
Hal Perkins  
Autumn 2005

10/26/2005

© 2002-05 Hal Perkins & UW CSE

E-1

## Agenda

- LR(0) state construction
- FIRST, FOLLOW, and nullable
- Variations SLR, LR(1), LALR

10/26/2005

© 2002-05 Hal Perkins & UW CSE

E-2

## LR State Machine

- Idea: Build a DFA that recognizes handles
  - Language generated by a CFG is generally not regular, but
  - Language of handles for a CFG is regular
    - So a DFA can be used to recognize handles
  - Parser reduces when DFA accepts

10/26/2005

E-3

## Prefixes, Handles, &c (review)

- If  $S$  is the start symbol of a grammar  $G$ ,
  - If  $S \Rightarrow^* \alpha$  then  $\alpha$  is a *sentential form* of  $G$
  - $\gamma$  is a *viable prefix* of  $G$  if there is some derivation  $S \Rightarrow_{rm}^* \alpha A w \Rightarrow_{rm}^* \alpha \beta w$  and  $\gamma$  is a prefix of  $\alpha \beta$ .
  - The occurrence of  $\beta$  in  $\alpha \beta w$  is a *handle* of  $\alpha \beta w$
- An *item* is a marked production (a . at some position in the right hand side)
  - $[A ::= . X Y]$   $[A ::= X . Y]$   $[A ::= X Y .]$

## Building the LR(0) States

- Example grammar
  - $S' ::= S \$$
  - $S ::= ( L )$
  - $S ::= x$
  - $L ::= S$
  - $L ::= L , S$
- We add a production  $S'$  with the original start symbol followed by end of file ( $\$$ )
- Question: What language does this grammar generate?

10/26/2005

© 2002-05 Hal Perkins & UW CSE

E-5

## Start of LR Parse

- Initially
  - Stack is empty
  - Input is the right hand side of  $S'$ , i.e.,  $S \$$
  - Initial configuration is  $[S' ::= . S \$]$
  - But, since position is just before  $S$ , we are also just before anything that can be derived from  $S$

$S' ::= S \$$   
 $S ::= ( L )$   
 $S ::= x$   
 $L ::= S$   
 $L ::= L , S$

10/26/2005

© 2002-05 Hal Perkins & UW CSE

E-6

$S' ::= S \$$   
 $S ::= ( L )$   
 $S ::= x$   
 $L ::= S$   
 $L ::= L, S$

## Initial state

$S' ::= . S \$$   
 $S ::= . ( L )$   
 $S ::= . x$

start →  $S' ::= . S \$$   
 completion →  $S ::= . ( L )$   
 completion →  $S ::= . x$

- A state is just a set of items
  - Start: an initial set of items
  - Completion (or closure): additional productions whose left hand side appears to the right of the dot in some item already in the state

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-7

$S' ::= S \$$   
 $S ::= ( L )$   
 $S ::= x$   
 $L ::= S$   
 $L ::= L, S$

## Shift Actions (1)

$S' ::= . S \$$   
 $S ::= . ( L )$   
 $S ::= . x$

 $\xrightarrow{x}$ 

$S ::= x .$

- To shift past the  $x$ , add a new state with the appropriate item(s)
  - In this case, a single item; the closure adds nothing
  - This state will lead to a reduction since no further shift is possible

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-8

$S' ::= S \$$   
 $S ::= ( L )$   
 $S ::= x$   
 $L ::= S$   
 $L ::= L, S$

## Shift Actions (2)

$S' ::= . S \$$   
 $S ::= . ( L )$   
 $S ::= . x$

 $\xrightarrow{(}$ 

$S ::= ( . L )$   
 $L ::= . L, S$   
 $L ::= . S$   
 $S ::= . ( L )$   
 $S ::= . x$

- If we shift past the  $($ , we are at the beginning of  $L$
- the closure adds all productions that start with  $L$ , which requires adding all productions starting with  $S$

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-9

$S' ::= S \$$   
 $S ::= ( L )$   
 $S ::= x$   
 $L ::= S$   
 $L ::= L, S$

## Goto Actions

$S' ::= . S \$$   
 $S ::= . ( L )$   
 $S ::= . x$

 $\xrightarrow{S}$ 

$S' ::= S . \$$

- Once we reduce  $S$ , we'll pop the rhs from the stack exposing the first state. Add a *goto* transition on  $S$  for this.

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-10

## Basic Operations

- Closure ( $S$ )**
  - Adds all items implied by items already in  $S$
- Goto ( $I, X$ )**
  - $I$  is a set of items
  - $X$  is a grammar symbol (terminal or non-terminal)
  - Goto* moves the dot past the symbol  $X$  in all appropriate items in set  $I$

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-11

## Closure Algorithm

- Closure ( $S$ ) =**
  - repeat
  - for any item  $[A ::= \alpha . X \beta]$  in  $S$
  - for all productions  $X ::= \gamma$
  - add  $[X ::= . \gamma]$  to  $S$
  - until  $S$  does not change
  - return  $S$

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-12

## Goto Algorithm

- $Goto(I, X) =$ 
  - set  $new$  to the empty set
  - for each item  $[A ::= \alpha . X \beta]$  in  $I$ 
    - add  $[A ::= \alpha X . \beta]$  to  $new$
  - return  $Closure(new)$
- This may create a new state, or may return an existing one

10/26/2005

© 2002-05 Hal Perkins & UW CSE

E-13

## LR(0) Construction

- First, augment the grammar with an extra start production  $S' ::= S \$$
- Let  $T$  be the set of states
- Let  $E$  be the set of edges
- Initialize  $T$  to  $Closure([S' ::= . S \$])$
- Initialize  $E$  to empty

10/26/2005

© 2002-05 Hal Perkins & UW CSE

E-14

## LR(0) Construction Algorithm

- repeat
- for each state  $I$  in  $T$ 
    - for each item  $[A ::= \alpha . X \beta]$  in  $I$ 
      - Let  $new$  be  $Goto(I, X)$
      - Add  $new$  to  $T$  if not present
      - Add  $I \xrightarrow{X} new$  to  $E$  if not present
- until  $E$  and  $T$  do not change in this iteration
- Footnote: For symbol  $\$,$  we don't compute  $goto(I, \$)$ ; instead, we make this an *accept* action.

10/26/2005

© 2002-05 Hal Perkins & UW CSE

E-15

## LR(0) Reduce Actions

- Algorithm:
  - Initialize  $R$  to empty
  - for each state  $I$  in  $T$ 
    - for each item  $[A ::= \alpha .]$  in  $I$ 
      - add  $(I, A ::= \alpha)$  to  $R$

10/26/2005

© 2002-05 Hal Perkins & UW CSE

E-16

## Building the Parse Tables (1)

- For each edge  $I \xrightarrow{X} J$ 
  - if  $X$  is a terminal, put  $s_j$  in column  $X$ , row  $I$  of the action table (shift to state  $j$ )
  - If  $X$  is a non-terminal, put  $g_j$  in column  $X$ , row  $I$  of the goto table

10/26/2005

© 2002-05 Hal Perkins & UW CSE

E-17

## Building the Parse Tables (2)

- For each state  $I$  containing an item  $[S' ::= S . \$]$ , put *accept* in column  $\$$  of row  $I$
- Finally, for any state containing  $[A ::= \gamma .]$  put action  $r_n$  in every column of row  $I$  in the table, where  $n$  is the production number

10/26/2005

E-18

## Example: States for

$S' ::= S \$$   
 $S ::= ( L )$   
 $S ::= x$   
 $L ::= S$   
 $L ::= L, S$

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-19

## Example: Tables for

$S' ::= S \$$   
 $S ::= ( L )$   
 $S ::= x$   
 $L ::= S$   
 $L ::= L, S$

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-20

## Where Do We Stand?

- We have built the LR(0) state machine and parser tables
  - No lookahead yet
  - Different variations of LR parsers add lookahead information, but basic idea of states, closures, and edges remains the same

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-21

## A Grammar that is not LR(0)

- Build the state machine and parse tables for a simple expression grammar
 
$$S ::= E \$$$

$$E ::= T + E$$

$$E ::= T$$

$$T ::= x$$

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-22

## LR(0) Parser for

0.  $S ::= E \$$   
 1.  $E ::= T + E$   
 2.  $E ::= T$   
 3.  $T ::= x$

	x	+	\$	E	T
1	s5			acc	
2					r2
3	r2	s4, r2	r2		
4	s5			g6	G3
5	r3	r3	r3		
6	r1	r1	r1		

- State 3 is has two possible actions on +
  - shift 4, or reduce 2
- ∴ Grammar is not LR(0)

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-23

## SLR Parsers

- Idea: Use information about what can follow a non-terminal to decide if we should perform a reduction
- Easiest form is SLR – Simple LR
- So we need to be able to compute FOLLOW( $A$ ) – the set of symbols that can follow  $A$  in any possible derivation
  - But to do this, we need to compute FIRST( $\gamma$ ) for strings  $\gamma$  that can follow  $A$

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-24

## Calculating FIRST( $\gamma$ )

- Sounds easy... If  $\gamma = XYZ$ , then FIRST( $\gamma$ ) is FIRST( $X$ ), right?
- But what if we have the rule  $X ::= \epsilon$ ?
- In that case, FIRST( $\gamma$ ) includes anything that can follow an  $X$  – i.e. FOLLOW( $X$ )

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-25

## FIRST, FOLLOW, and nullable

- nullable( $X$ ) is true if  $X$  can derive the empty string
- Given a string  $\gamma$  of terminals and non-terminals, FIRST( $\gamma$ ) is the set of terminals that can begin strings derived from  $\gamma$ .
- FOLLOW( $X$ ) is the set of terminals that can immediately follow  $X$  in some derivation
- All three of these are computed together

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-26

## Computing FIRST, FOLLOW, and nullable (1)

- Initialization
  - set FIRST and FOLLOW to be empty sets
  - set nullable to false for all non-terminals
  - set FIRST[a] to a for all terminal symbols a

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-27

## Computing FIRST, FOLLOW, and nullable (2)

```

repeat
  for each production  $X ::= Y_1 Y_2 \dots Y_k$ 
    if  $Y_1 \dots Y_k$  are all nullable (or if  $k = 0$ )
      set nullable[ $X$ ] = true
    for each  $i$  from 1 to  $k$  and each  $j$  from  $i+1$  to  $k$ 
      if  $Y_1 \dots Y_{i-1}$  are all nullable (or if  $i = 1$ )
        add FIRST[ $Y_i$ ] to FIRST[ $X$ ]
      if  $Y_{i+1} \dots Y_k$  are all nullable (or if  $i = k$ )
        add FOLLOW[ $X$ ] to FOLLOW[ $Y_i$ ]
      if  $Y_{i+1} \dots Y_{j-1}$  are all nullable (or if  $i+1=j$ )
        add FIRST[ $Y_j$ ] to FOLLOW[ $Y_i$ ]
  Until FIRST, FOLLOW, and nullable do not change
  
```

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-28

## Example

Grammar	nullable	FIRST	FOLLOW
$Z ::= d$		$x$	
$Z ::= XYZ$			
$Y ::= \epsilon$		$y$	
$Y ::= c$			
$X ::= Y$			
$X ::= a$		$z$	

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-29

## SLR Construction

- This is identical to LR(0) – states, etc., except for the calculation of reduce actions
- Algorithm:
  - Initialize  $R$  to empty
  - for each state  $I$  in  $\mathcal{T}$ 
    - for each item  $[A ::= \alpha \cdot]$  in  $I$ 
      - for each terminal  $a$  in FOLLOW( $A$ )
        - add  $(I, a, A ::= \alpha)$  to  $R$
        - i.e., reduce  $\alpha$  to  $A$  in state  $I$  only on lookahead  $a$

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-30

## SLR Parser for

0.  $S ::= E \$$   
 1.  $E ::= T + E$   
 2.  $E ::= T$   
 3.  $T ::= x$

	x	+	\$	E	T
1	s5			g2	g3
2		acc			
3	r2	s4, r2	r2		
4	s5			g6	g3
5	r3	r3	r3		
6	r1	r1	r1		

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-31

## On To LR(1)

- Many practical grammars are SLR
- LR(1) is more powerful yet
- Similar construction, but notion of an item is more complex, incorporating lookahead information

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-32

## LR(1) Items

- An LR(1) item  $[A ::= \alpha . \beta, a]$  is
  - A grammar production ( $A ::= \alpha\beta$ )
  - A right hand side position (the dot)
  - A lookahead symbol ( $a$ )
- Idea: This item indicates that  $\alpha$  is the top of the stack and the next input is derivable from  $\beta a$ .
- Full construction: see the book

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-33

## LR(1) Tradeoffs

- LR(1)
  - Pro: extremely precise; largest set of grammars
  - Con: potentially very large parse tables with many states

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-34

## LALR(1)

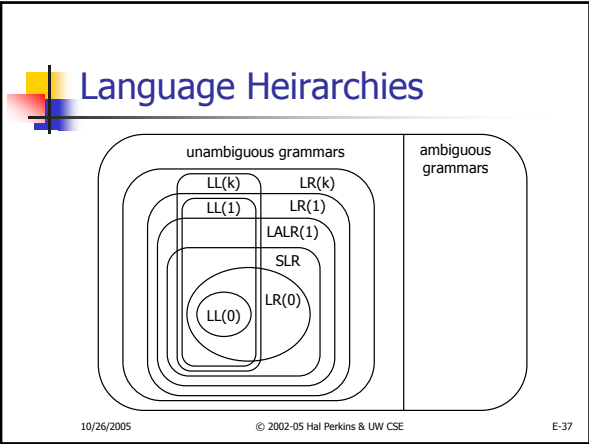

- Variation of LR(1), but merge any two states that differ only in lookahead
  - Example: these two would be merged
    - $[A ::= x ., a]$
    - $[A ::= x ., b]$

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-35

## LALR(1) vs LR(1)

- LALR(1) tables can have many fewer states than LR(1)
- LALR(1) may have reduce conflicts where LR(1) would not (but in practice this doesn't happen often)

10/26/2005 © 2002-05 Hal Perkins & UW CSE E-36

- ## Coming Attractions
- LL(k) Parsing – Top-Down
  - Recursive Descent Parsers
    - What to do if you need a parser in a hurry
- 10/26/2005      © 2002-05 Hal Perkins & UW CSE      E-38
