## Reading

- Chapter 33

Lecture 8 - Computational Geometry

2

## Outline for the Evening

- Convex Hull
- Line Segment Intersection
- Voronoi Diagram

Lecture 8 - Computational Geometry

3

## Geometric Algorithms

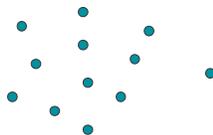

- Algorithms about points, lines, planes, polygons, triangles, rectangles and other geometric objects.
- Applications in many fields
  - robotics, graphics, CAD/CAM, geographic systems

Lecture 8 - Computational Geometry

4

## Convex Hull in 2-dimension

- Given  $n$  points on the plane find the smallest enclosing curve.

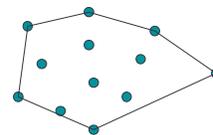

Lecture 8 - Computational Geometry

5

## Convex Hull in 2-dimension

- The convex hull is a polygon whose vertices are some of the points.

Lecture 8 - Computational Geometry

6

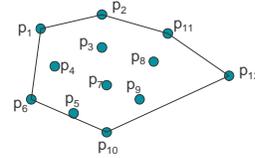

## Definition of Convex Hull Problem

- Input:  
Set of points  $p_1, p_2, \dots, p_n$  in 2 space. (Each point is an ordered pair  $p = (x,y)$  of reals.)
- Output:  
A sequence of points  $p_{i_1}, p_{i_2}, \dots, p_{i_k}$  such that traversing these points in order gives the convex hull.

Lecture 8 - Computational Geometry

7

## Example

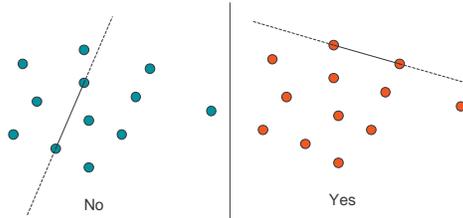

Input:  $p_1, p_2, p_3, p_4, p_5, p_6, p_7, p_8, p_9, p_{10}, p_{11}, p_{12}$   
Output:  $p_6, p_1, p_2, p_{11}, p_{12}, p_{10}$

Lecture 8 - Computational Geometry

8

## Slow Convex Hull Algorithm

- For each pair of points  $p, q$  determine if the line from  $p$  to  $q$  is on the convex hull.

Lecture 8 - Computational Geometry

9

## Slow Convex Hull Algorithm

- For each pair of points  $p, q$ , form the line that passes through  $p$  and  $q$  and determine if all the other points are on one side of the line.
  - If so the line from  $p$  to  $q$  is on the convex hull
  - Otherwise not
- Time Complexity is  $O(n^3)$ 
  - Constant time to test if point is on one side of the line from  $(p_1, p_2)$  to  $(q_1, q_2)$ .

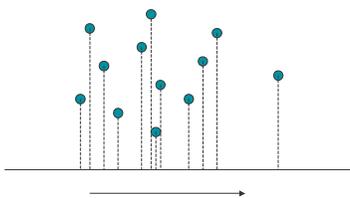

$$0 = (q_2 - p_2)x + (p_1 - q_1)y + p_2q_1 - p_1q_2$$

Lecture 8 - Computational Geometry

10

## Graham's Scan Convex Hull Algorithm

- Sort the points from left to right (sort on the first coordinate in increasing order)

Lecture 8 - Computational Geometry

11

## Convex Hull Algorithm

- Process the points in left to right order

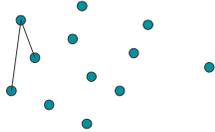

Lecture 8 - Computational Geometry

## Convex Hull Algorithm

- Left Turn – back up

Lecture 8 - Computational Geometry

42

## Convex Hull Algorithm

- Done!

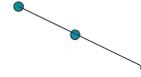

Lecture 8 - Computational Geometry

43

## Co-linear Points

- Not a left turn
  - Middle point is **included** in the convex hull

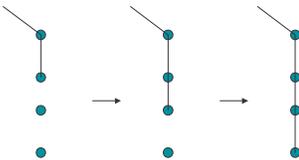

Lecture 8 - Computational Geometry

44

## Vertical Points

- Sort
  - First **increasing** in x
  - Second **decreasing** in y

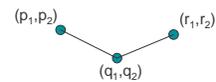

Lecture 8 - Computational Geometry

45

## Testing For Left Turn

- **Slope increases** from one segment to next

$$\text{left turn } \frac{q_2 - p_2}{q_1 - p_1} < \frac{r_2 - q_2}{r_1 - q_1}$$

$$(q_2 - p_2)(r_1 - q_1) < (r_2 - q_2)(q_1 - p_1) \quad \text{to avoid dividing by zero}$$

Lecture 8 - Computational Geometry

46

## Time Complexity of Graham's Scan

- Sorting –  $O(n \log n)$
- During the scan each point is “visited” at most twice
  - Initial visit
  - back up visit (happens at most once)
- Scan –  $O(n)$
- Total time  $O(n \log n)$
- This is best possible because sorting is reducible to finding convex hull.

Lecture 8 - Computational Geometry

47

## Exercise

- Find an algorithm that, given two sets of points A and B on the plane, determines if there is a line that separates the two sets.

Lecture 8 - Computational Geometry

48

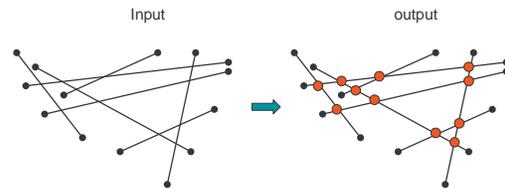

## Notes on Convex Hull

- $O(n \log n)$ 
  - Graham (1972)
- $O(n h)$  algorithm where  $h$  is the size of hull
  - Jarvis' March, "Gift wrapping" (1973)
  - Output sensitive algorithm
- $O(n \log h)$  algorithm where  $h$  is size of hull
  - Kirkpatrick and Seidel (1986)
- $d$ -dimensional Convex Hull
  - $\Omega(n^{d/2})$  in the worst case because the output can be this large.

Lecture 8 - Computational Geometry

49

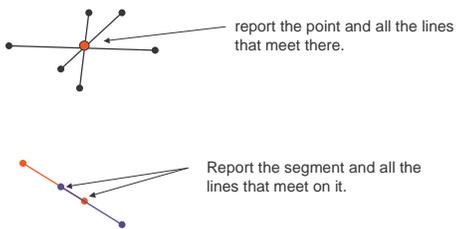

## Line Segment Intersection Problem

Lecture 8 - Computational Geometry

50

## Special cases

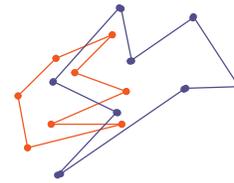

Lecture 8 - Computational Geometry

51

## Polygon Intersection

- Polygons have no self intersections

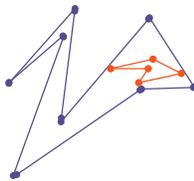

Use line segment intersection to solve polygon intersection

Lecture 8 - Computational Geometry

52

## Polygon Intersection

- What if no line segment intersections?

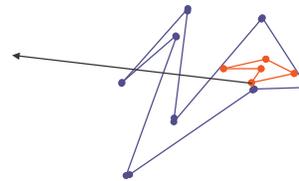

Lecture 8 - Computational Geometry

53

## Polygon Intersection

- Intersect a ray from each polygon with the other
  - Inside, if ray has an odd number of intersections, otherwise outside. Jordan curve theorem (1887).

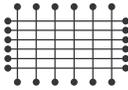

Lecture 8 - Computational Geometry

54

## Issues

- With  $n$  line segments there may be  $O(n^2)$  intersections.

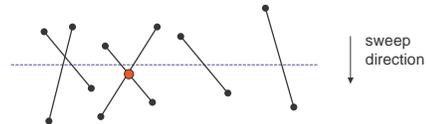

- Goal: Good output sensitive algorithm
  - $O(n \log n + s)$  would be ideal where  $s$  is the number of intersections.

Lecture 8 - Computational Geometry

55

## Plane Sweep Algorithm

- Sweep a plane vertically from top to bottom maintaining the set of known future events.
- Events
  - Beginning of a segment
  - End of a segment
  - Intersection to two “adjacent” segments

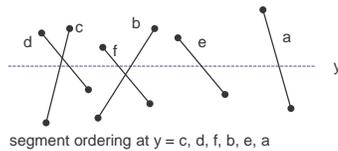

Lecture 8 - Computational Geometry

56

## Segment List

- We maintain ordered list of segments

Lecture 8 - Computational Geometry

57

## Key Idea in the Algorithm

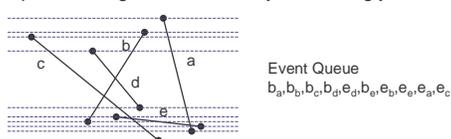

- Just before an intersection event the two line segments must be **adjacent** in the segment order.
- When a **new adjacency** occurs between two lines we must check for a possible new intersection event.

Lecture 8 - Computational Geometry

58

## Initialization

- Event Queue
  - contains all the beginning points and all the end points of segments ordered by decreasing  $y$  value.

- Segment List
  - Empty

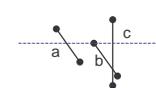

Lecture 8 - Computational Geometry

59

## Algorithm

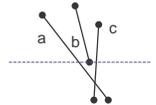

- Remove the next event from the event queue

**begin segment event**

1. Insert  $b$  into the segment list between  $a$  and  $c$
2. Check for intersections with adjacent segments  $(a,b)$  and  $(b,c)$ , and add any to event queue

**end segment event**

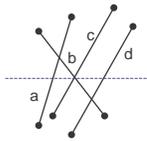

1. Delete  $b$  from the segment list
2. Check for intersections with adjacent segments  $(a,c)$ , and add any to event queue

Lecture 8 - Computational Geometry

60

## Algorithm

intersection event event

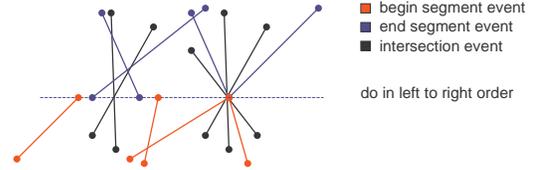

1. Reverse the order of b and c on the segment list
2. Check for intersections with adjacent segments (a,c) and (b,d) and add any to event queue

Lecture 8 - Computational Geometry

61

## Complications

- Several events can coincide.

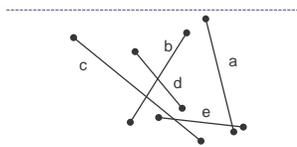

- Horizontal lines

begin end

Lecture 8 - Computational Geometry

62

## Example

Segment List

 $e_{c'}$

Lecture 8 - Computational Geometry

76

### Example

Segment List

Event Queue

Lecture 8 - Computational Geometry

77

### Data Structures

- Event List
  - Priority queue ordered by decreasing y, then by increasing x
  - Delete minimum, Insertion
- Segment List
  - Balanced binary tree search tree
  - Insertion, Deletion
  - Reversal can be done by deletions and insertions
- Time per event is  $O(\log n)$

Lecture 8 - Computational Geometry

78

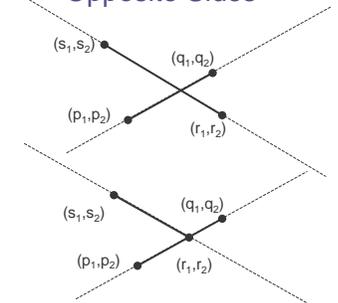

## Finding Line Segment Intersections

- Given line segments  $(p_1, p_2), (q_1, q_2)$  and  $(r_1, r_2), (s_1, s_2)$  do they intersect, and if so where.
- Where? Solve
  - $0 = (q_2 - p_2)x + (p_1 - q_1)y + p_2q_1 - p_1q_2$
  - $0 = (s_2 - r_2)x + (r_1 - s_1)y + r_2s_1 - r_1s_2$
- If?
  - $(p_1, p_2)$  and  $(q_1, q_2)$  on opposite sides of line  $(r_1, r_2), (s_1, s_2)$  and
  - $(r_1, r_2)$  and  $(s_1, s_2)$  on opposite sides of line  $(p_1, p_2), (q_1, q_2)$

Lecture 8 - Computational Geometry

79

## Opposite Sides

Lecture 8 - Computational Geometry

80

## Exercise

- A simple polygon is one that does not intersect itself. A polygon is given as a sequence of points  $(x_1, y_1), (x_2, y_2), \dots, (x_n, y_n)$ ,

Simple

Non-simple

- Design an algorithm for determining if a polygon is simple or not.

Lecture 8 - Computational Geometry

81

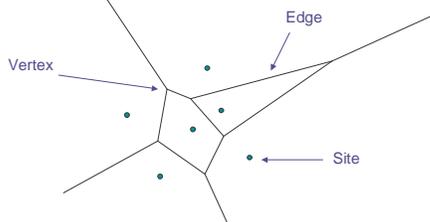

## Notes on Line Segment Intersection

- Total time for plane sweep algorithm is  $O(n \log n + s \log n)$  where  $s$  is the number of intersections.
  - $n \log n$  for the initial sorting
  - $\log n$  per event
- Plane sweep algorithms were pioneered by Shamos and Hoey (1975).
- Intersection Reporting - Bentley and Ottmann (1979)

Lecture 8 - Computational Geometry

82

## Voronoi Diagram

Each site defines an area of points nearest to it. Boundaries are perpendicular bisectors.

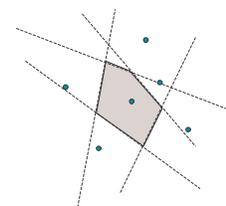

<http://www.cs.cornell.edu/Info/People/chew/Delaunay>

Lecture 8 - Computational Geometry

83

## Brute Force

- Each Voronoi area is the intersection of half spaces defined by perpendicular bisectors.

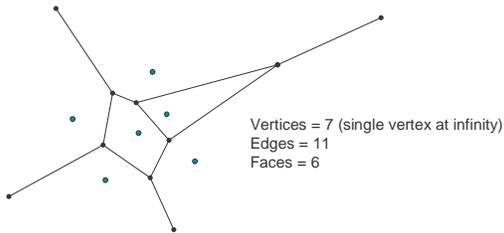

$O(n^2 \log n)$  time

Lecture 8 - Computational Geometry

84

## Linear Size of Voronoi Diagram

- The Voronoi Diagram is a planar embedding so it obeys Euler's equation  $V - E + F = 2$

Lecture 8 - Computational Geometry

85

## Linear Size of Voronoi Diagram

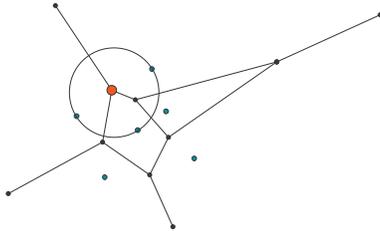

- $F = E - V + 2$  (Euler's equation)
- $n = F$  (one site per face)
- $2E \geq 3V$  because each vertex is of degree at least 3 and each edge has 2 vertices.
- $n \geq 3V/2 - V + 2 = V/2 + 2$
- $2n - 2 \geq V$
- $n > E - (2n - 2) + 2$
- $3n - 4 \geq E$

Lecture 8 - Computational Geometry

86

## Properties Voronoi Diagram

1. A vertex is the center of a circle through at least three sites

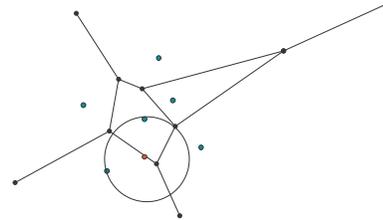

Lecture 8 - Computational Geometry

87

## Properties Voronoi Diagram

2. A point on a perpendicular bisector of sites p and q is on an edge if the circle centered at the point through p and q contains no other sites.

Lecture 8 - Computational Geometry

88

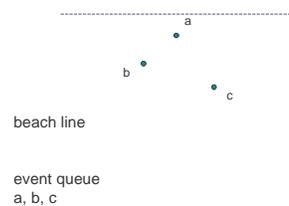

## Fortune's Sweep

- We maintain a "beach line," a sequence of parabolic segments that is the set of points equidistant from a site and the sweep line.
- Events
  - Site event - new site is encountered by the sweep line
  - Circle event - new vertex is inserted into the Voronoi diagram

Lecture 8 - Computational Geometry

89

## Example

Lecture 8 - Computational Geometry

a, b, c, a

event queue

Lecture 8 - Computational Geometry

98

## Example

beach line  
a, b, c, a

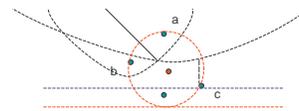

event queue

Lecture 8 - Computational Geometry

99

## Event Queue

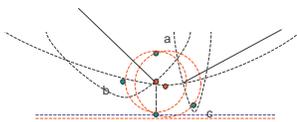

- Contains site events and circle events sorted by y in decreasing order, then by x in increasing order
- Circle events can be both inserted and deleted.

Lecture 8 - Computational Geometry

100

## Two New Circle Events

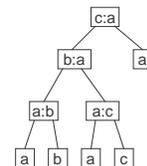

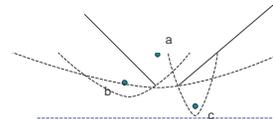

Lecture 8 - Computational Geometry

101

## Beach Line

- Implemented as a balanced binary search tree.
  - sites at leaves
  - breakpoints at internal nodes

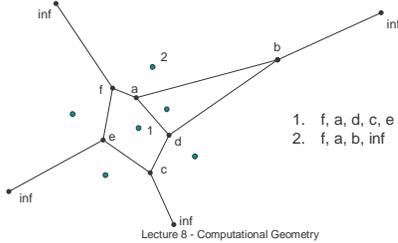

Lecture 8 - Computational Geometry

102

## Output

- For each site output the vertices in clockwise order. When a circle event occurs add to the vertex list of the three (or more) sites.

## Complexity

- Number of segments in the beach line  $\leq 2n$ 
  - Each site event adds at most 2 segments.
- Number of circle event insertions  $\leq 2n$ 
  - Each site event creates at most 2 circle events.
- Time per event is  $O(\log n)$ 
  - Insert new segments into the segment tree.
  - Insert new circle events into the event queue
  - Delete circle events from the event queue
- Total time is  $O(n \log n)$

Lecture 8 - Computational Geometry

104

## Voronoi Diagram Notes

- Voronoi diagram
  - Dirichlet (1850), Voronoi (1907)
- $O(n \log n)$  algorithm
  - Divide and conquer - Shamos and Hoey (1975)
  - Plane sweep – Fortune (1987)

Lecture 8 - Computational Geometry

105

## Exercise

- Give an  $O(n \log n)$  algorithm which given a set of  $n$  points on the plane, for each point finds its nearest neighbor.

Lecture 8 - Computational Geometry

106

## Numerics

- Computational geometry algorithms need exact arithmetic over rational numbers or algebraic numbers (solutions to polynomial equations over rationals).
  - In most cases there are predicates  $P(x,y)$  that need to be checked.
  - Example of predicates are  $x < y$  and  $x = y$
- Checking such predicates is very time consuming.
  - There are techniques like interval arithmetic to avoid these exact computations.

Lecture 8 - Computational Geometry

107

## More Computational Geometry Problems

- Nearest neighbor search
- Closest pair
- Union of objects
- Silhouette

Lecture 8 - Computational Geometry

108
