Aliasing

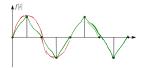

Ray tracing is a form of sampling and can suffer from annoying visual artifacts...

Consider a continuous function f(x). Now sample it at intervals Δ to give $f[i] = \text{quantize}[f(i\Delta)]$.

Q: How well does f[i] approximate f(x)?

Consider sampling a sinusoid:

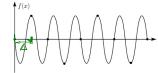

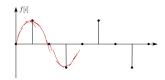

In this case, the sinusoid is reasonably well approximated by the samples.

Aliasing (con't)

Now consider sampling a higher frequency sinusoid

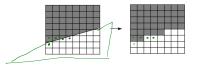

We get the exact same samples, so we seem to be approximating the first lower frequency sinusoid again.

We say that, after sampling, the higher frequency sinusoid has taken on a new "alias", i.e., changed its identity to be a lower frequency sinusoid.

Aliasing and anti-aliasing in rendering

One of the most common rendering artifacts is the "jaggies". Consider rendering a white polygon against a black background:

We would instead like to get a smoother transition:

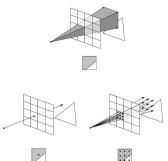

Anti-aliasing is the process of removing high frequencies *before* they cause aliasing.

In a renderer, computing the average color within a pixel is a good way to anti-alias. How exactly do we compute the average color?

Antialiasing in a ray tracer

We would like to compute the average intensity in the neighborhood of each pixel.

When casting one ray per pixel, we are likely to have aliasing artifacts.

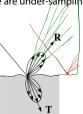

To improve matters, we can cast more than one ray per pixel and average the result.

A.k.a., super-sampling and averaging down.

Gloss and translucency

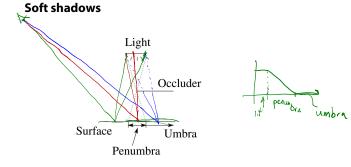

The mirror-like form of reflection, when used to approximate glossy surfaces, introduces a kind of aliasing, because we are under-sampling reflection (and refraction).

For example:

Distributing rays over reflection directions gives:

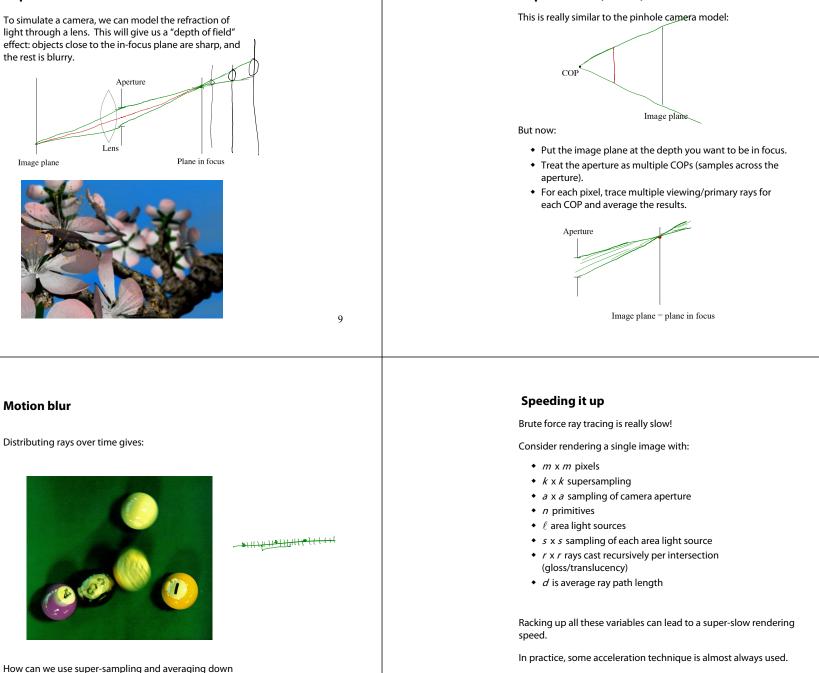

Distributing rays over light source area gives:

5

Depth of field

to get motion blur?

We've already looked at reducing *d* with adaptive (early) ray termination.

Depth of field (cont'd)

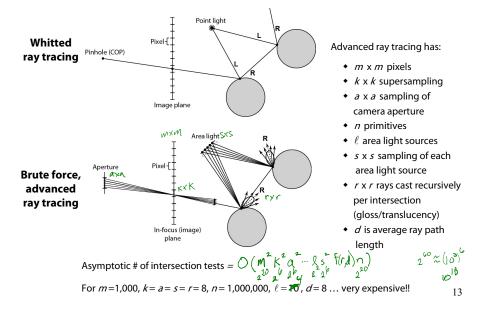

Now we look at reducing the effect of the *a*, *s*, *r*, *k* and *n* terms...

12

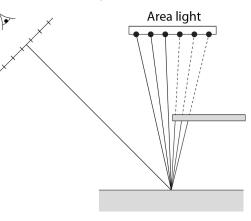

Naively improving Whitted ray tracing

Consider Whitted vs. a brute force approach with anti-aliasing, depth of field, area lights, gloss...

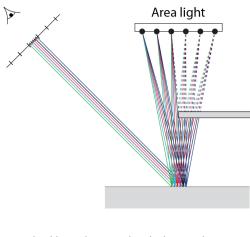

Penumbra revisited

Let's revisit the area light source...

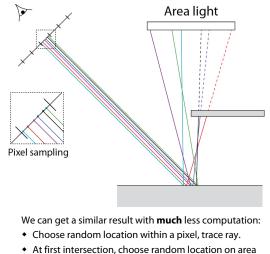

We can trace a ray from the viewer through a pixel, but now when we hit a surface, we cast rays to samples on the area light source.

Penumbra revisited

We should anti-alias to get best looking results. Whoa, this is a lot of rays...just for one pixel!!

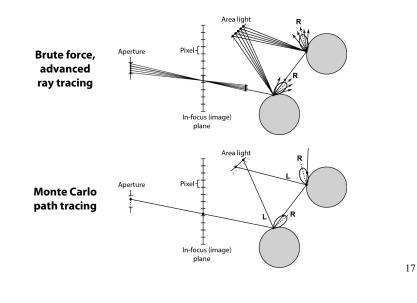

Penumbra revisited

- At first intersection, choose random location on area light source and trace shadow ray.
- Continue recursion as with Whitted, but always choose random location on area light for shadow ray.

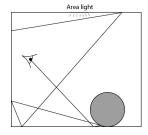

Monte Carlo Path Tracing vs. Brute Force

We can generalize this idea to do random sampling for each viewing ray, shadow ray, reflected ray, etc. This approach is called Monte Carlo Path Tracing (MCPT).

Noise and MCPT

You can also model diffuse interreflection by reflecting rays in completely random directions (and weighting the result of each bounce by **N•d**).

[http://web.stanford.edu/~dritchie/path]

MCPT images tend to be noisy, especially with depth of field or diffuse interreflection. Reduce noise by:

32 samp.

64 samp.

[http://scratchapixel.com]

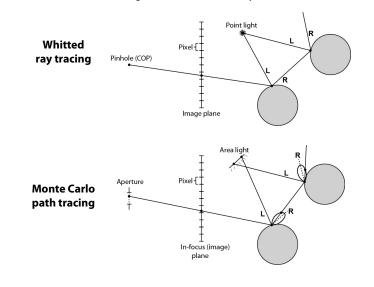

128 samp

- Casting many rays per pixel (lots of anti-aliasing)
- Importance sampling (choose rays that are likely to collect the most energy)
- Stratified sampling (distribute rays "evenly" to avoid accidentally casting rays that are too close together)
- Filtering the final result (e.g., fancy bilateral filtering)

MCPT vs. Whitted

Q: For a fixed number of rays per pixel, does MCPT \mathcal{N}_{O} trace more total rays than Whitted?

Q: Does MCPT give the same answer every time? \mathcal{N}_0

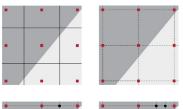

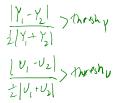

Antialiasing by adaptive sampling

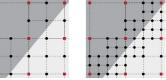

Casting many rays per pixel can be unnecessarily costly. If there are no rapid changes in intensity at the pixel, maybe only a few samples are needed.

Solution: adaptive sampling.

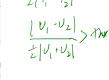

area?

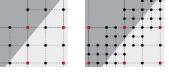

JIII+ III

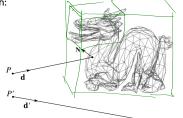

Q: When do we decide to cast more rays in a particular I - I2 > thresh

Faster ray-polyhedron intersection

Straightforward method

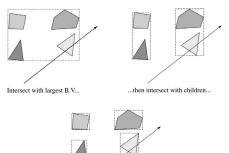

- intersect the ray with each triangle
- return the intersection with the smallest *t*-value.

Q: How might you speed this up?

BBOY

Bounding Volume Hierarchies (BVHs)

...until you reach the leaf nodes - the primitives.

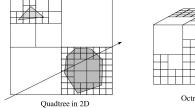

Key: build balanced trees with tight bounding volumes.

21

23

Non-uniform spatial subdivision: octrees

Another approach is **non-uniform spatial subdivision**. One version of this is octrees:

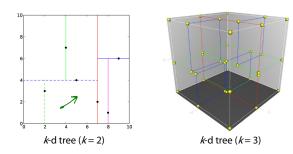

Non-uniform spatial subdivision: k-d trees

Another non-uniform subdivision is k-d

(*k*-dimensional) trees:

If the planes can be non-axis aligned, then you get BSP (binary space partitioning) trees.

Various combinations of these ray intersections techniques are also possible.

Summary

What to take home from this lecture:

- The meanings of all the boldfaced terms.
- An intuition for what aliasing is.
- How to reduce aliasing artifacts in a ray tracer
- The limitations of Whitted ray tracing (no glossy surfaces, etc.)
- The main idea behind Monte Carlo path tracing and what effects it can simulate (glossy surfaces, etc.)
- An intuition for how ray tracers can be accelerated.
