Texture mapping

Texture mapping allows you to take a simple polygon and give it the appearance of something much more complex.

- Due to Ed Catmull, PhD thesis, 1974
- Refined by Blinn & Newell, 1976

A texture can modulate just about any parameter – diffuse color, specular color, specular exponent, …
Implementing texture mapping

A texture lives in it own abstract image coordinates paramaterized by \((u, v)\) in the range \([0..1], [0..1]\):

It can be wrapped around many different surfaces:

With a ray caster, we can do the sphere and cylinder mappings directly (as we will see later). For graphics hardware, everything gets converted to a triangle mesh with associated \((u, v)\) coordinates.

Note: if the surface moves/deforms, the texture goes with it.
Texture coordinates on a surface of revolution

Recall that for a surface of revolution, we have:

**Profile curve:** \( C[j] \) where \( j \in [0..M-1] \)

**Rotation angles:** \( \theta[i] = 2\pi i / N \) where \( i \in [0..N] \)

The simplest assignment of texture coordinates would be:

\[ U = \frac{i}{N} \]

Note that you should include the rotation angles for \( i = 0 \) and \( i = N \), even though they produce the same points (after rotating by 0 and \( 2\pi \)). Why do this??
Texture coordinates on a surface of revolution

If we wrap an image around this surface of revolution, what artifacts would we expect to see?

We can reduce distortion in \( v \). Define:

\[
d[j] = \begin{cases} 
\|C[j] - C[j-1]\|, & \text{if } j \neq 0 \\
0, & \text{if } j = 0 
\end{cases}
\]

and set \( v \) to fractional distance along the curve:

\[
v = \frac{1}{\sum_{k=0}^{M-1} d[j]} \sum_{k=0}^{M-1} \frac{d[j]}{d[j]}
\]

You must do this for \( v \) for the programming assignment!
Mapping to texture image coords

The texture is usually stored as an image. Thus, we need to convert from abstract texture coordinate:

\[(u, v)\] in the range \([0..1], [0..1]\)

to texture image coordinates:

\[(u_{\text{tex}}, v_{\text{tex}})\] in the range \([0..w_{\text{tex}}], [0..h_{\text{tex}}]\)

Q: What do you do when the texture sample you need lands between texture pixels?
Texture resampling

We need to resample the texture:

Thus, we seek to solve for: \( T(a,b) = T(i + \Delta_x, j + \Delta_y) \)

A common choice is \textbf{bilinear interpolation}:

\[
T(i + \Delta_x, j) = (1 - \Delta_x) T[i, j] + \Delta_x T[i + 1, j]
\]

\[
T(i + \Delta_x, j + 1) = (1 - \Delta_x) T[i, j + 1] + \Delta_x T[i + 1, j + 1]
\]

\[
T(i + \Delta_x, j + \Delta_y) = (1 - \Delta_y) T(i + \Delta_x, j) + \Delta_y T(i + \Delta_x, j + 1)
\]

\[
= (1 - \Delta_x)(1 - \Delta_y) T[i, j] + \Delta_x(1 - \Delta_y) T[i + 1, j] + \Delta_y(1 - \Delta_x) T[i, j + 1] + \Delta_x \Delta_y T[i + 1, j + 1]
\]
Texture mapping and rasterization

Texture-mapping can also be handled in rasterization algorithms.

**Method:**
- Scan conversion is done in screen space, as usual
- Each pixel is colored according to the texture
- Texture coordinates are found by Gouraud-style interpolation

**Note:** Mapping is more complicated to handle perspective correctly.
Displacement mapping

Textures can be used for more than just color.

In **displacement mapping**, a texture is used to perturb the surface geometry itself. Here’s the idea in 2D:

\[ \tilde{Q}(u) = Q(u) + d(u)N(u) \]

- These displacements “animate” with the surface
- In 3D, you would of course have \((u, v)\) parameters instead of just \(u\).

Suppose \(Q\) is a simple surface, like a cube. Will it take more work to render the modified surface \(\tilde{Q}\)? **Yes**
**Bump mapping**

In **bump mapping**, a texture is used to perturb the normal:

- Use the original, simpler geometry, \( Q(u) \), for hidden surfaces
- Use the normal from the displacement map for shading:

\[
\tilde{N} = \text{normal}[\tilde{Q}(u)]
\]

What artifacts in the images would reveal that bump mapping is fake?

- Silhouettes will be smooth
- Shadows will be smooth
- No self-occlusion
Displacement vs. bump mapping

Input texture

Rendered as displacement map over a rectangular surface

Solid textures

Q: What kinds of artifacts might you see from using a marble veneer instead of real marble?

One solution is to use solid textures:

- Use model-space coordinates to index into a 3D texture
- Like “carving” the object from the material

One difficulty of solid texturing is coming up with the textures.
Solid textures (cont'd)

Here's an example for a vase cut from a solid marble texture:

*Solid marble texture by Ken Perlin, (Foley, IV-21)*
Solid textures (cont'd)

\[ \text{in}(x, y, z) = \text{stripes}(x) \]
\[ \text{shift}(x, y, z) = K \cdot \text{noise}(x, y, z) \]
\[ \text{out}(x, y, z) = \text{stripes}(x + \text{shift}(x, y, z)) \]

Increasing \( K \)

Increasing \( K \)

Increasing \( K \)
Environment mapping

In environment mapping (also known as reflection mapping), a texture is used to model an object's environment:

- Rays are bounced off objects into environment
- Color of the environment used to determine color of the illumination
- Environment mapping works well when there is just a single object – or in conjunction with ray tracing

This can be readily implemented (without interreflection) in graphics hardware using a fragment shader, where the texture is stored in a “cube map” instead of a sphere.

With a ray tracer, the concept is easily extended to handle refraction as well as reflection (and interreflection).
Summary

What to take home from this lecture:

1. The meaning of the boldfaced terms.

2. Familiarity with the various kinds of texture mapping, including their strengths and limitations.
