Reading

Forsyth & Ponce, chapter 7

3

What is an image?

4

Images as functions

We can think of an **image** as a function, f , from \mathbb{R}^2 to \mathbb{R} :

- $f(x, y)$ gives the **intensity** at position (x, y)
- Realistically, we expect the image only to be defined over a rectangle, with a finite range:
 - $f: [a,b] \times [c,d] \rightarrow [0,1]$

A color image is just three functions pasted together. We can write this as a “vector-valued” function:

$$f(x, y) = \begin{bmatrix} r(x, y) \\ g(x, y) \\ b(x, y) \end{bmatrix}$$

5

Images as functions

6

What is a digital image?

In computer vision we usually operate on **digital (discrete)** images:

- **Sample** the 2D space on a regular grid
- **Quantize** each sample (round to nearest integer)

If our samples are Δ apart, we can write this as:

$$f[i, j] = \text{Quantize}\{f(i \Delta, j \Delta)\}$$

The image can now be represented as a matrix of integer values

	$\overset{j}{\rightarrow}$							
\downarrow i	62	79	23	119	120	105	4	0
	10	10	9	62	12	78	34	0
	10	59	197	46	46	0	0	48
	176	135	5	188	191	68	0	49
	2	1	1	29	26	37	0	77
	0	89	144	147	187	102	62	208
	255	252	0	166	123	62	0	31
	166	63	127	17	1	0	99	30

7

Image processing

An **image processing** operation typically defines a new image g in terms of an existing image f .

We can transform either the domain or the range of f .

Range transformation:

$$g(x, y) = t(f(x, y))$$

What's kinds of operations can this perform?

8

Image processing

Some operations preserve the range but change the domain of f :

$$g(x, y) = f(t_x(x, y), t_y(x, y))$$

What kinds of operations can this perform?

9

Image processing

Still other operations operate on both the domain *and* the range of f .

10

Noise

Image processing is useful for noise reduction...

Original

Salt and pepper noise

Impulse noise

Gaussian noise

Common types of noise:

- **Salt and pepper noise:** contains random occurrences of black and white pixels
- **Impulse noise:** contains random occurrences of white pixels
- **Gaussian noise:** variations in intensity drawn from a Gaussian normal distribution

11

Ideal noise reduction

12

Ideal noise reduction

13

Practical noise reduction

How can we "smooth" away noise in a single image?

	10	20	30	30	30	30	20	10	
	10	10	10	0	0	0	0	0	

Effect of mean filters

Cross-correlation filtering

Let's write this down as an equation. Assume the averaging window is $(2k+1) \times (2k+1)$:

$$G[i, j] = \frac{1}{(2k+1)^2} \sum_{u=-k}^k \sum_{v=-k}^k F[i+u, j+v]$$

We can generalize this idea by allowing different weights for different neighboring pixels:

$$G[i, j] = \sum_{u=-k}^k \sum_{v=-k}^k H[u, v] F[i+u, j+v]$$

This is called a **cross-correlation** operation and written:

$$G = H \otimes F$$

H is called the "filter," "kernel," or "mask."

The above allows negative filter indices. When you implement need to use: $H[u+k, v+k]$ instead of $H[u, v]$

Mean kernel

What's the kernel for a 3x3 mean filter?

0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0
0	0	0	90	90	90	90	90	0	0
0	0	0	90	90	90	90	90	0	0
0	0	0	90	90	90	90	90	0	0
0	0	0	90	0	90	90	90	0	0
0	0	0	90	90	90	90	90	0	0
0	0	0	0	0	0	0	0	0	0
0	0	90	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0

$H[u, v]$

$F[x, y]$

Gaussian Filtering

A Gaussian kernel gives less weight to pixels further from the center of the window

0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0
0	0	0	90	90	90	90	90	0	0
0	0	0	90	90	90	90	90	0	0
0	0	0	90	90	90	90	90	0	0
0	0	0	90	0	90	90	90	0	0
0	0	0	90	90	90	90	90	0	0
0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0	0	0

$$\frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix} H[u, v]$$

$$F[x, y]$$

This kernel is an approximation of a Gaussian function:

$$h(u, v) = \frac{1}{2\pi\sigma^2} e^{-\frac{u^2+v^2}{\sigma^2}}$$

What happens if you increase σ ?

21

Mean vs. Gaussian filtering

22

Filtering an impulse

a	b	c
d	e	f
g	h	i

$$H[u, v]$$

0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	0	1	0	0	0	0
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0

$$F[x, y]$$

$$G[x, y]$$

23

Convolution

A **convolution** operation is a cross-correlation where the filter is flipped both horizontally and vertically before being applied to the image:

$$G[i, j] = \sum_{u=-k}^k \sum_{v=-k}^k H[u, v] F[i - u, j - v]$$

It is written: $G = H \star F$

Suppose H is a Gaussian or mean kernel. How does convolution differ from cross-correlation?

Suppose F is an impulse function (previous slide) What will G look like?

24

Continuous Filters

We can also apply filters to *continuous* images.

In the case of cross correlation: $g = h \otimes f$

$$g(x, y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} h(u, v) f(x + u, y + v) du dv$$

In the case of convolution: $g = h \star f$

$$g(x, y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} h(u, v) f(x - u, y - v) du dv$$

Note that the image and filter are infinite.

25

Median filters

A **Median Filter** operates over a window by selecting the median intensity in the window.

What advantage does a median filter have over a mean filter?

Is a median filter a kind of convolution?

26

Comparison: salt and pepper noise

27

Comparison: Gaussian noise

28
