

Announcements

- Project 1 artifact voting
- Project 2 out today
 - panorama signup
 - help session at end of class
- Guest lectures next week: Li Zhang, Jiwon Kim

Mosaics

Full screen panoramas (cubic): <http://www.panoramas.dk/>
Mars: http://www.panoramas.dk/fullscreen3f2_mars97.html
2003 New Years Eve: <http://www.panoramas.dk/fullscreen3f1.html>

Today's Readings

- Szeliski and Shum paper (sections 1 and 2, skim the rest)
 - <http://www.acm.org/pubs/citations/proceedings/graph/258734/p251-szeliski/>

Image Mosaics

Goal

- Stitch together several images into a seamless composite

How to do it?

Basic Procedure

- Take a sequence of images from the same position
 - Rotate the camera about its optical center
- Compute transformation between second image and first
 - Lucas & Kanade registration
- Shift the second image to overlap with the first
- Blend the two together to create a mosaic
- If there are more images, repeat

Aligning images

How to account for warping?

- Translations are not enough to align the images
- [Photoshop demo](#)

Image reprojection

The mosaic has a natural interpretation in 3D

- The images are reprojected onto a common plane
- The mosaic is formed on this plane

Image reprojection

Basic question

- How to relate two images from the same camera center?
 - how to map a pixel from PP1 to PP2

Answer

- Cast a ray through each pixel in PP1
- Draw the pixel where that ray intersects PP2

Don't need to know what's in the scene!

Image reprojection

Observation

- Rather than thinking of this as a 3D reprojection, think of it as a 2D image warp from one image to another

Homographies

Perspective projection of a plane

- Lots of names for this:
 - **homography**, texture-map, colineation, planar projective map
- Modeled as a 2D warp using homogeneous coordinates

$$\begin{bmatrix} wx' \\ wy' \\ w \end{bmatrix} = \begin{bmatrix} * & * & * \\ * & * & * \\ * & * & * \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

$$\mathbf{p}' = \mathbf{H} \mathbf{p}$$

To apply a homography \mathbf{H}

- Compute $\mathbf{p}' = \mathbf{H}\mathbf{p}$ (regular matrix multiply)
- Convert \mathbf{p}' from homogeneous to image coordinates
 - divide by w (third coordinate)

Image warping with homographies

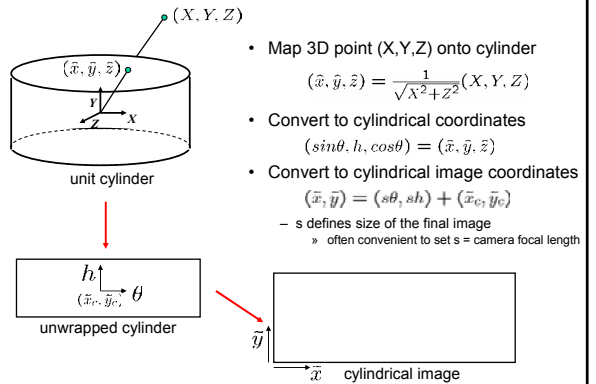

Panoramas

What if you want a 360° field of view?

Cylindrical projection

Cylindrical reprojection

How to map from a cylinder to a planar image?

side view

top-down view

- Apply camera projection matrix
 - or use the version of projection that properly accounts for radial distortion, as discussed in projection slides. This is what you'll do for project 2.

Cylindrical reprojection

Image 384x300

f = 180 (pixels)

f = 280

f = 380

Map image to cylindrical coordinates

- need to know the focal length

Cylindrical panoramas

Steps

- Reproject each image onto a cylinder
- Blend
- Output the resulting mosaic

Cylindrical image stitching

What if you don't know the camera rotation?

- Solve for the camera rotations
 - Note that a pan (rotation) of the camera is a **translation** of the cylinder!
 - Use Lukas-Kanade to solve for translations of cylindrically-warped images

Assembling the panorama

Stitch pairs together, blend, then crop

Problem: Drift

Error accumulation

- small errors accumulate over time

Problem: Drift

Solution

- add another copy of first image at the end
- this gives a constraint: $y_n = y_1$
- there are a bunch of ways to solve this problem
 - add displacement of $(y_1 - y_n)/(n - 1)$ to each image after the first
 - compute a global warp: $y' = y + ax$
 - run a big optimization problem, incorporating this constraint
 - » best solution, but more complicated
 - » known as "bundle adjustment"

Full-view Panorama

Different projections are possible

Project 2 (out today)

1. Take pictures on a tripod (or handheld)
2. Warp to cylindrical coordinates
3. Automatically compute pair-wise alignments
4. Correct for drift
5. Blend the images together
6. Crop the result and import into a viewer

Image Blending

Feathering

Effect of window size

Effect of window size

Good window size

"Optimal" window: smooth but not ghosted

- Doesn't always work...

Pyramid blending

Create a Laplacian pyramid, blend each level

- Burt, P. J. and Adelson, E. H., [A multiresolution spline with applications to image mosaics](#), ACM Transactions on Graphics, 42(4), October 1983, 217-236.

Alpha Blending

Optional: see Blinn (CGA, 1994) for details:
<http://www.cse.cmu.edu/~jeff/107/lec13/0375100010749.pdf?hlsName=76318prod=JN1&numbe=3107408a&SI=83&end=87&Author=Blinn%2C+J.F.>

Encoding blend weights: $I(x,y) = (\alpha R, \alpha G, \alpha B, \alpha)$

color at $p = \frac{(\alpha_1 R_1, \alpha_1 G_1, \alpha_1 B_1) + (\alpha_2 R_2, \alpha_2 G_2, \alpha_2 B_2) + (\alpha_3 R_3, \alpha_3 G_3, \alpha_3 B_3)}{\alpha_1 + \alpha_2 + \alpha_3}$

Implement this in two steps:

1. accumulate: add up the (α premultiplied) RGB α values at each pixel
2. normalize: divide each pixel's accumulated RGB by its α value

Q: what if $\alpha = 0$?

Poisson Image Editing

Image warping

Given a coordinate transform $(x',y') = h(x,y)$ and a source image $f(x,y)$, how do we compute a transformed image $g(x',y') = f(h(x,y))$?

Forward warping

Send each pixel $f(x,y)$ to its corresponding location $(x',y') = h(x,y)$ in the second image

Q: what if pixel lands "between" two pixels?

Forward warping

Send each pixel $f(x,y)$ to its corresponding location $(x',y') = h(x,y)$ in the second image

Q: what if pixel lands “between” two pixels?

A: distribute color among neighboring pixels (x',y')
– Known as “splatting”

Inverse warping

Get each pixel $g(x',y')$ from its corresponding location $(x,y) = h^{-1}(x',y')$ in the first image

Q: what if pixel comes from “between” two pixels?

Inverse warping

Get each pixel $g(x',y')$ from its corresponding location $(x,y) = h^{-1}(x',y')$ in the first image

Q: what if pixel comes from “between” two pixels?

A: *resample* color value
– We discussed resampling techniques before
• nearest neighbor, bilinear, Gaussian, bicubic

Forward vs. inverse warping

Q: which is better?

A: usually inverse—eliminates holes
• however, it requires an invertible warp function—not always possible...

Other types of mosaics

Can mosaic onto *any* surface if you know the geometry

- See NASA's [Visible Earth project](http://earthobservatory.nasa.gov/Newsroom/BlueMarble/) for some stunning earth mosaics
 - <http://earthobservatory.nasa.gov/Newsroom/BlueMarble/>

AutoStitch

Method so far is not completely automatic

- need to know which pairs fit together
- need to initialize Lukas-Kanade to get good results

Newer methods are fully automatic

- AutoStitch, by Matthew Brown and David Lowe:
 - <http://www.cs.ubc.ca/~mbrown/autostitch/autostitch.html>
- Based on feature matching techniques (next lecture)
