SPIHT  
Group Testing

The Zero-Tree Method

- Invented by Shapiro, 1993, and refined by Said and Pearlman, 1996.

If a bit plane value in a low resolution subband is insignificant then it is likely that the corresponding values in higher subbands are also insignificant in the same bit plane.

Such groups of insignificant values are called **zero-trees**.

CSEP 590 - Lecture 11 - Autumn 2007

2

Zero-Tree Example

Values in a zero-tree are correlated.

CSEP 590 - Lecture 11 - Autumn 2007

3

Simplified SPIHT Coding

- Runs in passes - one for each bit plane.
- $C[i,j]$  is the coefficient at index  $(i,j)$  and  $C[i,j,k]$  is the  $k$ -th bit of  $C[i,j]$ .
- Encoder maintains two data structures.
  - $S$ , a list of indices  $(i,j)$  such that  $C[i,j]$  is declared significant in the current bit plane.
  - $Z$ , a stack of zero trees of two types.
    - rootless (R)
    - root-and-childless (RC)
  - The nodes in a zero tree are insignificant in the current bit plane. (ignore root in R and root and children in RC)

CSEP 590 - Lecture 11 - Autumn 2007

4

SPIHT Zero-Trees

CSEP 590 - Lecture 11 - Autumn 2007

5

R-Tree Example (1)

CSEP 590 - Lecture 11 - Autumn 2007

6

### R-Tree Example (2)

Example of zero-tree (R,3,1)

in S

CSEP 590 - Lecture 11 - Autumn 2007 7

### RC-Tree Example

Example of zero-tree (RC,1,1)

in S

CSEP 590 - Lecture 11 - Autumn 2007 8

### Initialization of SPIHT

- The lowest subband indices are put into S.
  - If  $(i,j)$  in lowest subband then output sign (0 for - and 1 for +) of  $C[i,j]$  and put  $(i,j)$  into S.
- A stack Z of zero trees is formed using the lowest resolution subband indices as roots.
  - If  $(i,j)$  in the lowest subband is a root of a zero tree of type R if  $i$  is odd or ( $i$  is even and  $j$  is odd).

lowest subband

CSEP 590 - Lecture 11 - Autumn 2007 9

### Iteration of SPIHT Encoder

k-th iteration

We have list S of significant values and a stack Z of zero trees from the previous pass or the initialization.

Significance Pass.

```

while Z is not empty do
  T := pop(Z);
  if T has an index that becomes significant in bit plane k then
    output 1;
    decompose(T);
  else
    output 0;
    push T on Z'
  Z := Z'; {At this point all indices in zero trees in Z are insignificant}

```

Refinement Pass.

for each  $(i,j)$  in S output the k-th significant bit,  $C[i,j,k]$ .

CSEP 590 - Lecture 11 - Autumn 2007 10

### Decomposition of R

Output the sign (0 for - and 1 for +) of each of the children of the root and put them in S. Push the RC tree on the stack Z. Exception is when tree has no grandchildren. In this case, the tree dies.

CSEP 590 - Lecture 11 - Autumn 2007 11

### Decomposition of RC

Push each of the four trees on the stack Z.

CSEP 590 - Lecture 11 - Autumn 2007 12

### SPIHT Coding Example: Initialization

in S

Initial data structure:

$S = (0,0), (0,1), (1,0), (1,1)$

$Z = (R,0,1), (R,1,0), (R,1,1)$

Initial output:  
0 1 1 1

sign(0,0) = -  
sign(0,1) = +  
sign(1,0) = +  
sign(1,1) = +

CSEP 590 - Lecture 11 - Autumn 2007

13

### SPIHT Coding Example: Pass 1, Significance Pass (1)

became significant  
in S

$S = (0,0), (0,1), (1,0), (1,1)$

$Z = (R,0,1), (R,1,0), (R,1,1)$

(R,0,1) is significant  
output 1

$S = (0,0), (0,1), (1,0), (1,1),$   
 $(0,2), (0,3), (1,2), (1,3)$

output 1101 for signs of these  
 $Z = (RC,0,1), (R,1,0), (R,1,1)$

CSEP 590 - Lecture 11 - Autumn 2007

14

### SPIHT Coding Example: Pass 1, Significance Pass (2)

became significant  
in S

$S = (0,0), (0,1), (1,0), (1,1),$   
 $(0,2), (0,3), (1,2), (1,3)$

$Z = (RC,0,1), (R,1,0), (R,1,1)$

(RC,0,1) is not significant  
output 0

$S = (0,0), (0,1), (1,0), (1,1),$   
 $(0,2), (0,3), (1,2), (1,3)$

$Z = (R,1,0), (R,1,1)$   
 $Z' = (RC,0,1)$

CSEP 590 - Lecture 11 - Autumn 2007

15

### SPIHT Coding Example: Pass 1, Significance Pass (3)

became significant  
in S

$S = (0,0), (0,1), (1,0), (1,1),$   
 $(0,2), (0,3), (1,2), (1,3)$

$Z = (R,1,0), (R,1,1)$

$Z' = (RC,0,1)$

(R,1,0) is significant  
output 1

$S = (0,0), (0,1), (1,0), (1,1),$   
 $(0,2), (0,3), (1,2), (1,3),$   
 $(2,0), (2,1), (3,0), (3,1)$

output 1100 for signs of these  
 $Z = (RC,1,0), (R,1,1)$   
 $Z' = (RC,0,1)$

CSEP 590 - Lecture 11 - Autumn 2007

16

### SPIHT Coding Example: Pass 1, Significance Pass (4)

became significant  
in S

$S = (0,0), (0,1), (1,0), (1,1),$   
 $(0,2), (0,3), (1,2), (1,3),$   
 $(2,0), (2,1), (3,0), (3,1)$

$Z = (RC,1,0), (R,1,1)$   
 $Z' = (RC,0,1)$

(RC,1,0) is significant  
output 1

$S = (0,0), (0,1), (1,0), (1,1),$   
 $(0,2), (0,3), (1,2), (1,3),$   
 $(2,0), (2,1), (3,0), (3,1)$

$Z = (R,2,0), (R,2,1), (R,3,0),$   
 $(R,3,1), (R,1,1)$   
 $Z' = (RC,0,1)$

CSEP 590 - Lecture 11 - Autumn 2007

17

### SPIHT Coding Example: Pass 1, Significance Pass (5)

became significant  
in S

$S = (0,0), (0,1), (1,0), (1,1),$   
 $(0,2), (0,3), (1,2), (1,3),$   
 $(2,0), (2,1), (3,0), (3,1)$

$Z = (R,2,0), (R,2,1), (R,3,0),$   
 $(R,3,1), (R,1,1)$

$Z' = (RC,0,1)$

(R,2,0) is not significant  
output 0

$S = (0,0), (0,1), (1,0), (1,1),$   
 $(0,2), (0,3), (1,2), (1,3),$   
 $(2,0), (2,1), (3,0), (3,1)$

$Z = (R,2,1), (R,3,0), (R,3,1), (R,1,1)$   
 $Z' = (R,2,0), (RC,0,1)$

CSEP 590 - Lecture 11 - Autumn 2007

18

### SPIHT Coding Example: Pass 1, Significance Pass (6)

■ became significant  
■ in S

$S = (0,0), (0,1), (1,0), (1,1), (0,2), (0,3), (1,2), (1,3), (2,0), (2,1), (3,0), (3,1)$   
 $Z = (R,2,1), (R,3,0), (R,3,1), (R,1,1)$   
 $Z' = (R,2,0), (RC,0,1)$

(R,2,1) is significant  
output 1

$S = (0,0), (0,1), (1,0), (1,1), (0,2), (0,3), (1,2), (1,3), (2,0), (2,1), (3,0), (3,1), (4,2), (4,3), (5,2), (5,3)$   
output 1010 for signs of these  
 $Z = (R,3,0), (R,3,1), (R,1,1)$   
 $Z' = (R,2,0), (RC,0,1)$

CSEP 590 - Lecture 11 - Autumn 2007 19

### SPIHT Coding Example: Pass 1, Significance Pass (7)

■ became significant  
■ in S

$S = (0,0), (0,1), (1,0), (1,1), (0,2), (0,3), (1,2), (1,3), (2,0), (2,1), (3,0), (3,1), (4,2), (4,3), (5,2), (5,3)$   
 $Z = (R,3,0), (R,3,1), (R,1,1)$   
 $Z' = (R,2,0), (RC,0,1)$

(R,3,0) is insignificant  
output 0

$S = (0,0), (0,1), (1,0), (1,1), (0,2), (0,3), (1,2), (1,3), (2,0), (2,1), (3,0), (3,1), (4,2), (4,3), (5,2), (5,3)$   
 $Z = (R,3,1), (R,1,1)$   
 $Z' = (R,3,0), (R,2,0), (RC,0,1)$

CSEP 590 - Lecture 11 - Autumn 2007 20

### SPIHT Coding Example: Pass 1, Significance Pass (8)

■ became significant  
■ in S

$S = (0,0), (0,1), (1,0), (1,1), (0,2), (0,3), (1,2), (1,3), (2,0), (2,1), (3,0), (3,1), (4,2), (4,3), (5,2), (5,3)$   
 $Z = (R,3,1), (R,1,1)$   
 $Z' = (R,3,0), (R,2,0), (RC,0,1)$

(R,3,1) is insignificant  
output 0

$S = (0,0), (0,1), (1,0), (1,1), (0,2), (0,3), (1,2), (1,3), (2,0), (2,1), (3,0), (3,1), (4,2), (4,3), (5,2), (5,3)$   
 $Z = (R,1,1)$   
 $Z' = (R,3,1), (R,3,0), (R,2,0), (RC,0,1)$

CSEP 590 - Lecture 11 - Autumn 2007 21

### SPIHT Coding Example: Pass 1, Significance Pass (9)

■ became significant  
■ in S

$S = (0,0), (0,1), (1,0), (1,1), (0,2), (0,3), (1,2), (1,3), (2,0), (2,1), (3,0), (3,1), (4,2), (4,3), (5,2), (5,3)$   
 $Z = (R,1,1)$   
 $Z' = (R,3,1), (R,3,0), (R,2,0), (RC,0,1)$

(R,1,1) is insignificant  
output 0

$S = (0,0), (0,1), (1,0), (1,1), (0,2), (0,3), (1,2), (1,3), (2,0), (2,1), (3,0), (3,1), (4,2), (4,3), (5,2), (5,3)$   
 $Z = (R,1,1), (R,3,1), (R,3,0), (R,2,0), (RC,0,1)$

CSEP 590 - Lecture 11 - Autumn 2007 22

### SPIHT Coding Example: Pass 1, Refinement Step

■ in S

$S = (0,0), (0,1), (1,0), (1,1), (0,2), (0,3), (1,2), (1,3), (2,0), (2,1), (3,0), (3,1), (4,2), (4,3), (5,2), (5,3)$   
 $Z = (R,1,1), (R,3,1), (R,3,0), (R,2,0), (RC,0,1)$

output 1011000100000010  
one bit for each member of S.

37 total bits in pass 1 were output. Initialization was 4 bits. Total of 41 bits to send 64 bits plus 16 sign bits.

CSEP 590 - Lecture 11 - Autumn 2007 23

### Exercise

■ in S

Initial data structure:

$S = (0,0), (0,1), (1,0), (1,1)$   
 $Z = (R,0,1), (R,1,0), (R,1,1)$

Initial output?:

$\text{sign}(0,0) = +$   
 $\text{sign}(0,1) = -$   
 $\text{sign}(1,0) = +$   
 $\text{sign}(1,1) = +$

CSEP 590 - Lecture 11 - Autumn 2007 24

## Exercise

became significant negative  
 in S

$S = (0,0), (0,1), (1,0), (1,1)$

$Z = (R,0,1), (R,1,0), (R,1,1)$

CSEP 590 - Lecture 11 - Autumn 2007

25

## SPIHT Decoding

- The decoder emulates the encoder.
  - The decoder maintains exactly the same data structures as the encoder.
  - When the decoder has popped the Z stack to examine a zero tree it receives a bit telling it whether the tree is significant. The decoder can then do the right thing.
    - If it is significant then it does the decomposition.
    - If it is not significant then it deduces a number of zeros in the current bit plane.

CSEP 590 - Lecture 11 - Autumn 2007

26

## SPIHT Decoder

### k-th iteration

We have list S of significant values and a stack Z of zero trees from the previous pass or the initialization.

### Significance Pass.

while Z is not empty do

  T := pop(Z);

  input := read;

  if input = 1 then decompose(T);

  else push T on Z;

Z := Z'; (At this point all indices in zero trees in Z are insignificant)

### Refinement Pass.

for each (i,j) in S do C[i,j,k] := read.

In decompose the signs of coefficients are input

CSEP 590 - Lecture 11 - Autumn 2007

27

## Notes on SPIHT

- SPIHT was very influential
  - People really came to believe that wavelet compression can really be practical (fast and effective).
- To yield the best compression an arithmetic coding step is added to SPIHT
  - The improvement is about .5 DB

CSEP 590 - Lecture 11 - Autumn 2007

28

## SPIHT-AC

Compression of Barbara

CSEP 590 - Lecture 11 - Autumn 2007

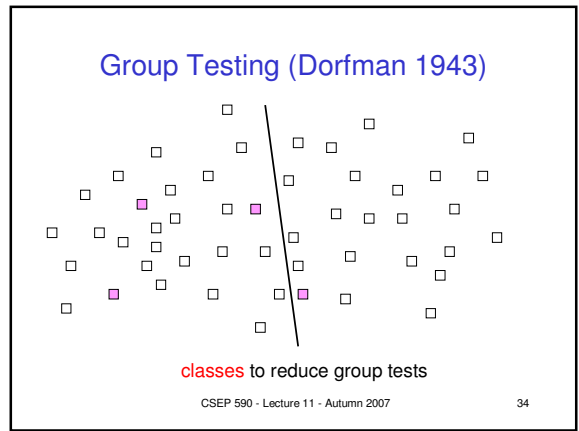

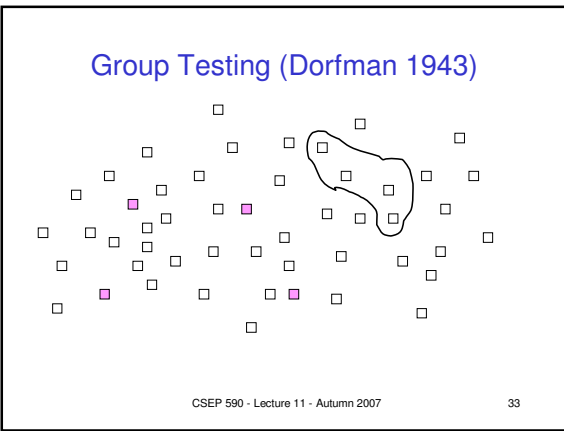

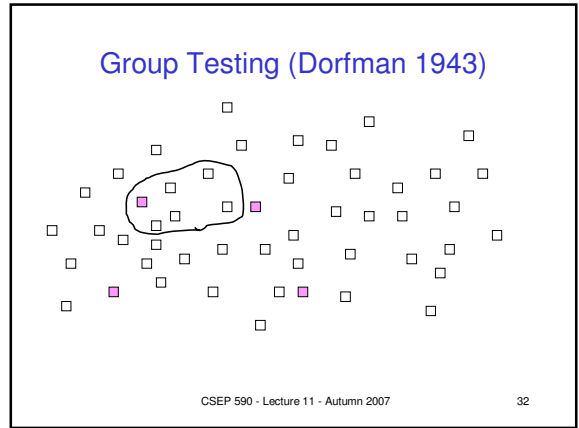

29

## Group Testing (Dorfman 1943)

- Given n items, with s items significant
- Use group tests to identify significant items
  - Group test of size k
    - Group is insignificant: all k items insignificant
    - Group is significant: at least one significant
- Goal: Minimize number of group tests

CSEP 590 - Lecture 11 - Autumn 2007

30

### Zerotree Coding as Group Testing

- Coefficients = items
- Testing trees for significance = group test
- Zerotree coding = one particular group testing algorithm
- Zerotree coding & group testing have similar goals

CSEP 590 - Lecture 11 - Autumn 2007 35

### Hwang's Group Testing Algorithm (1972)

- Repeat a **Group Iteration** until all significant items are found
- Group Iteration
  - Test group G containing k unidentified items
  - If G is significant, find a significant item in  $\log_2 k$  tests
    - Each subsequent test is a subset of G
    - Size of test group is halved each time

CSEP 590 - Lecture 11 - Autumn 2007 36

## Group Iteration of size 8

Group Test Result	Code	
<table border="1"> <tr> <td>? ? ? ? ? ? ? ?</td> </tr> </table> I I I I I I I I	? ? ? ? ? ? ? ?	Insignificant   0

- Equivalent to elementary Golomb code of order 8

CSEP 590 - Lecture 11 - Autumn 2007

38

## Group Testing for Wavelet Image Coding (GTW)

- Hong and Ladner (2000)
- New method for encoding significance pass:
  - Uses Hwang's Group Testing Algorithm
  - Divide wavelet coefficients into classes
  - Every group test performed is on coefficients in the same class

CSEP 590 - Lecture 11 - Autumn 2007

39

## GTW Significance Pass Overview

- Repeat until all coefficients are coded
  - Pick a set of coefficients from the class that is most likely to have significant coefficients.
  - Do one group iteration on the set. The group size is determined by the adaptive group tester.
    - Output the results of the group tests
  - If a significant coefficient is found then
    - Output its sign
    - Update classes of neighboring coefficients

CSEP 590 - Lecture 11 - Autumn 2007

40

## GTW's adaptive group tester

- Choosing group iteration size k:
  - Ramp up: start with k=1
    - While group insignificant, double k
  - Steady state: use past history to estimate probability p of insignificance
    - Optimal k using Gallager & Van Voorhis' (1975) result

$$k = \left\lceil -1 / \log_2 p \right\rceil$$

Same as the adaptive Golomb coding algorithm.

CSEP 590 - Lecture 11 - Autumn 2007

41

## GTW Classes

- Coefficients with similar characteristics put into the same class
- Classes are ordered so that classes with coefficients more likely to be significant are tested first.
- Class characteristics
  - Significant neighbor count
  - pattern type
  - Subband level

CSEP 590 - Lecture 11 - Autumn 2007

42

## Significant Neighbor Metric

- Count # of significant neighbors
- Example Neighborhood

CSEP 590 - Lecture 11 - Autumn 2007

43

## Pattern Type

- Accounts for correlation between neighbors
  - Example pattern types for a subband

CSEP 590 - Lecture 11 - Autumn 2007

44

## Subband Level

CSEP 590 - Lecture 11 - Autumn 2007

45

## Class Ordering

- Significant neighbor count
  - children count for at most 1
  - 0, 1, 2 or 3 or more
- Pattern Types 4 and Subband levels 7
- Total number of classes 112
- Ordering
  - First by significant neighbor count (large to small)
  - Second by pattern type (small to large)
  - Third by subband level (small to large)

CSEP 590 - Lecture 11 - Autumn 2007

46

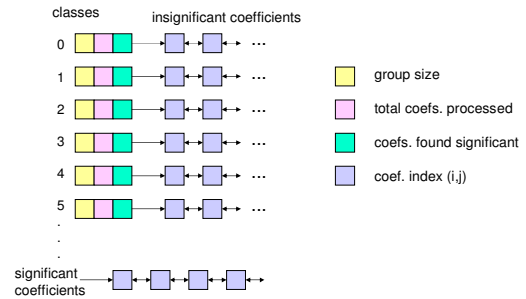

## Class Number vs. Group Size

Group Size scatterplot

47

## GTW Data Structures

CSEP 590 - Lecture 11 - Autumn 2007

48

## Decoding

- Decoding algorithm is identical to the encoding algorithm except
  - Decoder knows the results of group test from the compressed bit stream

CSEP 590 - Lecture 11 - Autumn 2007

49

## GTW Compression Performance

CSEP 590 - Lecture 11 - Autumn 2007

50

## Flexibility of Group Testing

- Flexibility
  - Significant data sent first
  - Classes defined to focus of significant data
  - Data can move from class to class
  - We always get a progressive coder
- Applications
  - DCT
  - Lapped Transforms
  - Wavelet Packets

CSEP 590 - Lecture 11 - Autumn 2007

51

## GT-DCT

- Hong, Ladner, Riskin (2001)
- Group testing for the discrete cosine transform.
- We do bit-plane coding of the DCT coefficients.
- DCT classes are defined.
- Group testing done first on the classes that have the smallest group size.

CSEP 590 - Lecture 11 - Autumn 2007

52

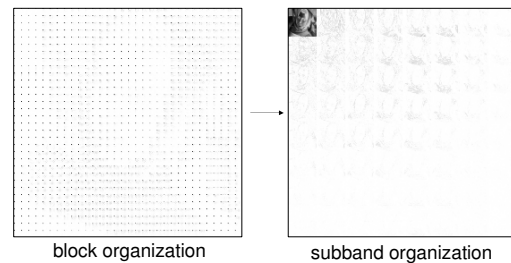

## Reorganizing Block Transform Coefficients

CSEP 590 - Lecture 11 - Autumn 2007

53

## Reorganizing Block Transform Coefficients

CSEP 590 - Lecture 11 - Autumn 2007

54

## GT-DCT Classes

- Based on subband reorganization of coefficients
- Class characteristics
  - Significant neighbor metric
  - Subband level

CSEP 590 - Lecture 11 - Autumn 2007

55

## Significant Neighbor Metric

- Count # of significant neighbors

CSEP 590 - Lecture 11 - Autumn 2007

56

## Subband Level

CSEP 590 - Lecture 11 - Autumn 2007

57

## GT-DCT vs JPEG

Compression of Barbara

CSEP 590 - Lecture 11 - Autumn 2007

58

## Group Testing Notes

- Group testing provides a unified and flexible way to approach bit-plane coding of transformed images.
  - Need good classes (contexts)
  - Need good group testing algorithms (adaptive Golomb coding works)
- Compression performance is outstanding
- Group testing is quite a bit more time consuming than JPEG and SPIHT.
  - need some good data structures and engineering

CSEP 590 - Lecture 11 - Autumn 2007

59
