Data Compression  
Autumn 2007

EBCOT  
JPEG 2000

History

- Embedded Block Coding with Optimized Truncation (EBCOT)
  - Taubman – journal paper 2000
  - Algorithm goes back to 1998 or maybe earlier
  - Basis of JPEG 2000
- Embedded
  - Prefixes of the encoded bit stream are legal encodings at lower fidelity, like SPIHT and GTW
- Block coding
  - Entropy coding of blocks of bit planes, not block transform coding like JPEG.

CSEP 590 - Lecture 12 - Autumn 2007

2

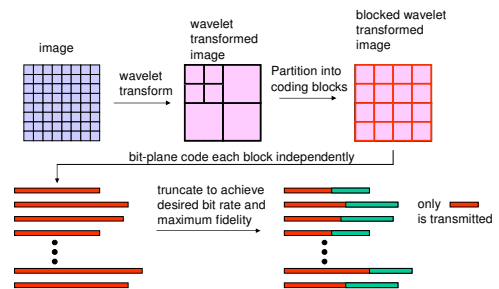

Features at a High Level

- SNR scalability (Signal to Noise Ratio)
  - Embedded code - The compressed bit stream can be truncated to yield a smaller compressed image at lower fidelity
  - Layered code – The bit stream can be partitioned into a base layer and enhancement layers. Each enhancement layer improves the fidelity of the image
- Resolution scalability
  - The lowest subband can be transmitted first yielding a smaller image at high fidelity.
  - Successive subbands can be transmitted to yield larger and larger images

## Resolution Ordering

CSEP 590 - Lecture 12 - Autumn 2007

7

## Block Coding

- Assume we are in block  $k$ , and  $c(i,j)$  is a coefficient in block  $k$ .
- Divide  $c(i,j)$  into its sign  $s(i,j)$  and  $m(i,j)$  its magnitude.
- Quantize to  $v(i,j) = \lfloor m(i,j)/q_k + .5 \rfloor$  where  $q_k$  is the quantization step for block  $k$ .
- Example:  $c(i,j) = -10$ ,  $q_k = 3$ .
  - $s(i,j) = 0$
  - $v(i,j) = \text{floor}(-10/3 + .5) = -2$

CSEP 590 - Lecture 12 - Autumn 2007

8

## Bit Planes of Normalized Quantized Coefficients

CSEP 590 - Lecture 12 - Autumn 2007

9

## Bit-Plane Coding of Blocks

- Sub-block significance coding (like group testing)
  - Some sub-blocks are declared insignificant
  - Significant sub-blocks must be coded
- Contexts are defined based on the previous bit-plane significance.
  - Zero coding (ZC) – 9 contexts
  - Run length coding (RLC) – 1 context
  - Sign coding (SC) – 5 contexts
  - Magnitude refinement coding (MR) – 3 contexts
- Block coded in raster order using arithmetic coding

CSEP 590 - Lecture 12 - Autumn 2007

10

## Sub-Block Significance Coding

- Quad-tree organized group testing
- Block divided into 16x16 sub-blocks
- Identify in few bits the sub-blocks that are significant

CSEP 590 - Lecture 12 - Autumn 2007

11

## Quad-Tree Subdivision

CSEP 590 - Lecture 12 - Autumn 2007

12

## Quad-Tree Subdivision

CSEP 590 - Lecture 12 - Autumn 2007

13

## Quad-Tree Subdivision Coding

Depth-first code = 1 for significant  
0 for insignificant

CSEP 590 - Lecture 12 - Autumn 2007

14

## Quad-Tree Subdivision Coding

known significant in last bit plane

Skip symbols that are already known:  
1. nodes significant in previous bit plane  
2. last child of significant parent of other children are insignificant

CSEP 590 - Lecture 12 - Autumn 2007

15

## ZC – Zero Coding

- LH is transposed so that it can be treated the same as HL.  $(LH)^T$  has similar characteristics to HL.
- Each coefficient has its neighbors in the **same** subband

vertical neighbors  
horizontal neighbors  
diagonal neighbors

CSEP 590 - Lecture 12 - Autumn 2007

16

## ZC Contexts

- $v$  = number of vertical neighbors significant in the previous bit-plane
- $h$  = number of horizontal neighbors significant in the previous bit-plane
- $d$  = number of diagonal neighbors significant in the previous bit-plane

$0 \leq h, v \leq 2$   
 $0 \leq d \leq 4$

higher labels mean more likely to be significant

| label | HL | (LH) <sup>T</sup> | LL | HH  |
|-------|----|-------------------|----|-----|
|       | h  | v                 | d  | h+v |
| 0     | 0  | 0                 | 0  | 0   |
| 1     | 0  | 0                 | 1  | 1   |
| 2     | 0  | 0                 | >1 | >1  |
| 3     | 0  | 1                 | *  | 1   |
| 4     | 0  | 2                 | *  | 1   |
| 5     | 1  | 0                 | 0  | >1  |
| 6     | 1  | 0                 | >0 | 2   |
| 7     | 1  | >0                | *  | >0  |
| 8     | 2  | *                 | *  | >2  |

CSEP 590 - Lecture 12 - Autumn 2007

Context 6

CSEP 590 - Lecture 12 - Autumn 2007

18

## RLC – Run Length Coding

- Looks for runs of 4 that are likely to be insignificant

|   |   |   |   |
|---|---|---|---|
| ? | ? | ? | ? |
|   |   |   |   |

- If all insignificant then code as a single symbol
- Main purpose – to lighten the load on the arithmetic coder.

CSEP 590 - Lecture 12 - Autumn 2007

19

## SC – Sign Coding

$$hs = \begin{cases} 0 & \text{if horizontal neighbors are both insignificant or of opposite sign} \\ 1 & \text{if at least one horizontal neighbor is positive} \\ -1 & \text{if at least one horizontal neighbor is negative} \end{cases}$$

$$vs = \begin{cases} 0 & \text{if vertical neighbors are both insignificant or of opposite sign} \\ 1 & \text{if at least one vertical neighbor is positive} \\ -1 & \text{if at least one vertical neighbor is negative} \end{cases}$$

|                 |   |   |    |    |   |    |    |
|-----------------|---|---|----|----|---|----|----|
| hs              | 1 | 1 | 1  | 0  | 0 | -1 | -1 |
| vs              | 1 | 0 | -1 | 1  | 0 | -1 | -1 |
| sign prediction | 1 | 1 | 1  | -1 | 1 | -1 | -1 |
| label           | 4 | 3 | 2  | 1  | 0 | 1  | 2  |

CSEP 590 - Lecture 12 - Autumn 2007

20

## MR – Magnitude Refinement

- This is the refinement pass.
- Define  $t = 0$  if first refinement bit,  $t = 1$  otherwise.

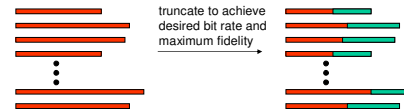

| label | t | h + v |
|-------|---|-------|
| 0     | 0 | 0     |
| 1     | 0 | > 0   |
| 2     | 1 | *     |

CSEP 590 - Lecture 12 - Autumn 2007

21

## Bit Allocation

- How do we truncate the encoded blocks to achieve a desired bit rate and get maximum fidelity

CSEP 590 - Lecture 12 - Autumn 2007

22

## Basic Set Up

- Encoded block  $k$  can be truncated to  $n_k$  bits.
- Total Bit Rate

$$\sum_k n_k$$

- Distortion attributable to block  $k$  is

$$D_k^{n_k} = w_k^2 \sum_{(i,j) \in B_k} (c^{n_k}(i,j) - c(i,j))^2$$

where  $w_k$  is the "weight" of the basis vectors for block  $k$  and  $c^{n_k}(i,j)$  is the recovered coefficients from  $n_k$  bits of block  $k$ .

CSEP 590 - Lecture 12 - Autumn 2007

23

## Bit Allocation as an Optimization Problem

- Input: Given  $m$  embedded codes and a bit rate target  $R$
- Output: Find truncation values  $n_k$ ,  $1 \leq k \leq m$ , such that

$$D = \sum_k D_k^{n_k} \text{ is minimized and}$$

$$\sum_k n_k \leq R$$

CSEP 590 - Lecture 12 - Autumn 2007

24

## Facts about Bit Allocation

- It is an NP-hard problem generally
- There are fast approximate algorithms that work well in practice
  - GBFOS
  - Lagrange multiplier method
  - Multiple choice knapsack method

CSEP 590 - Lecture 12 - Autumn 2007

25

## Rate-Distortion Curve

CSEP 590 - Lecture 12 - Autumn 2007

26

## Picture of Bit Allocation

Pick one point from each curve so that the sum of the x values is bounded by R and the sum of the y values is minimized.

Good approximate algorithms exist because the curves are almost convex.

CSEP 590 - Lecture 12 - Autumn 2007

27

## Notes on EBCOT

- EBCOT is quite complicated with many features.
- JPEG 2000 based on EBCOT but differs to improve compression and decompression time.
- EBCOT has
  - resolution scalability
  - SNR scalability
  - quantization
  - bit allocation
  - arithmetic coding with context and adaptivity
  - group testing (quad trees)
  - sign and refinement bit contexts
  - lots of engineering

CSEP 590 - Lecture 12 - Autumn 2007

28

## Notes on Wavelet Compression

- Wavelets appear to be excellent for image compression
  - No blocking artifacts
  - Wavelet coding techniques abound and are very effective
- Some of the wavelet coding techniques can apply to block transforms.
- Newest generation of image compressor use wavelets, JPEG 2000.

CSEP 590 - Lecture 12 - Autumn 2007
