

CSE 322
Introduction to Formal Models in Computer Science
Pre-midterm preparation

Winter 2004

Paul Beame

6 Feb 2004

The midterm is Friday, Feb. 13 in class. There will be a review session, Thursday Feb. 12 at 4:30, place TBA.

The midterm will cover up to the end of the material on Finite Automata.

1. Strings and languages and operations on them.
2. Regular expressions and regular languages.
3. Deterministic finite automata: Formal definition, δ^* , $L(M)$, as well as state diagrams.
4. Nondeterministic finite automata: Formal definition, $L(M)$ for NFA's as well as state diagrams.
5. Converting NFA's to DFA's: The subset construction.
6. Using finite automata for pattern matching.
7. Construction of an NFA to accept any regular language.
8. Construction of a regular expression representing the language accepted by any NFA.
9. Closure properties of regular languages, e.g. closure under complement, intersection, reversal.
10. Proofs that languages are not regular using the pumping lemma and using equivalence relation \equiv_A .
11. The fact that (not the proof) A is regular if and only if \equiv_A has a finite number of equivalence classes.
