

# CSE 332: Data Abstractions

## Lecture 25: Course Victory Lap

Ruth Anderson  
Spring 2013

# *Today*

- Rest-of-course logistics: exam, etc.
- Review of main course themes
- Some thoughts on “data structures and threads” together
- Course evaluations
  - Thoughtful and constructive feedback deeply appreciated
  - (Including what you liked)

# *Final Exam*

- Next **Tuesday**, June 11, 2:30-4:20
- In our regular lecture room.
- Ruth will hold office hours:
  - Mon June 10, 4:30-5:30pm
  - Tues June 11, 12-1:30pm
- Intention is to test a subset of the topics in **sorting, graphs, parallelism, concurrency, amortization**
  - In other words, “stuff not covered by the midterm”
  - But as always the course topics build on earlier ones, especially algorithm analysis
- May need to read and write Java, among other things
- Topics and Sample exams listed on course web site

# *Victory Lap*

A victory lap is an extra trip around the track

- By the exhausted victors (that's us) 😊

Review course goals

- Slides from Lecture 1
- What makes CSE332 special

# *Thank you!*

Big thank-you to your TAs:

**Hyeln & David**

- *Lots* of grading in CSE332: “free response” and “open design” better for students, harder for TAs

Now a few slides, completely unedited, from Lecture 1

- Hopefully they make more sense now
- Hopefully we succeeded

# *Data Structures + Threads*

- About 70% of the course is a “classic data-structures course”
  - Timeless, essential stuff
  - Core data structures and algorithms that underlie most software
  - How to analyze algorithms
- Plus a serious first treatment of programming with *multiple threads*
  - For *parallelism*: Use multiple processors to finish sooner
  - For *concurrency*: Correct access to shared resources
  - Will make many connections to the classic material

# *What 332 is about*

- Deeply understand the basic structures used in all software
  - Understand the data structures and their trade-offs
  - Rigorously analyze the algorithms that use them (math!)
  - Learn how to pick “the right thing for the job”
- Experience the purposes and headaches of multithreading
- Practice design, analysis, and implementation
  - The elegant interplay of “theory” and “engineering” at the core of computer science

# Goals

- You will understand:
  - what the tools are for storing and processing common data types
  - which tools are appropriate for which need
- So that you will be able to:
  - **make good design choices** as a developer, project manager, or system customer
  - **justify** and **communicate** your design decisions

# *Views on this course*

- Prof. Steve Seitz (graphics):
  - 100-level and some 300-level courses teach how to do stuff
  - 332 teaches **really cool** ways to do stuff
  - 400 level courses teach how to do **really cool** stuff
- Prof. James Fogarty (HCI):
  - Computers are fricking insane
    - Raw power can enable bad solutions to many problems
  - This course is about how to attack non-trivial problems
    - Problems where it actually matters how you do it

## *Views on this course*

- Prof. Dan Grossman (prog. langs.):  
Three years from now this course will seem like it was a waste of your time because you can't imagine not “just knowing” every main concept in it
  - Key abstractions computer scientists and engineers use almost **every day**
  - A big piece of what separates us from others

# *Views on this course*

- This is the class where you begin to think like a computer scientist
  - You stop thinking in Java or C++ code
  - You start thinking that this is a hashtable problem, a stack problem, etc.

# *Data structures?*

“Clever” ways to organize information in order to enable *efficient* computation over that information.

# *Trade-offs*

A data structure strives to provide many useful, efficient operations

But there are unavoidable trade-offs:

- Time vs. space
- One operation more efficient if another less efficient
- Generality vs. simplicity vs. performance

That is why there are many data structures and educated CSEers internalize their main trade-offs and techniques

- And recognize logarithmic < linear < quadratic < exponential

Now thoughts on teaching parallelism and concurrency in this class

# *Background*

- “Old” data structures course taught more data structures and algorithms
  - Splay trees, leftist heaps, skew heaps, disjoint-sets, ...
- Threads are way more important than they used to be
- “Data structures” is not what most faculty would think of for the “best place to fit it”...

# *The fit*

Hopefully it did not seem too odd to you, because:

- Work, span, Amdahl's Law are about asymptotics
- Fork-join is great for divide-and-conquer
- Sequential cutoffs are like quicksort/insertion-sort cutoffs
- ADTs shared by multiple threads need critical sections
- Queues motivate condition variables
- ... (several more examples)

Other main thesis: emphasize parallelism vs. concurrency distinction

- Not always widely appreciated
- Often mixed in practice

# *Last slide*

***What do you think was good about 332?***

***What could be improved?***

And:

Don't be a stranger: let me know how the rest of your time in CSE (and beyond!) goes... I really do like to know
