

CSE 332 Autumn 2023

Lecture 18: Graphs

Nathan Brunelle

<http://www.cs.uw.edu/332>

RadixSort

- Radix: The base of a number system
 - We'll use base 10, most implementations will use larger bases
- Idea:
 - BucketSort by each digit, one at a time, from least significant to most significant

103	801	401	323	255	823	999	101	113	901	555	512	245	800	018	121
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Place each element into a "bucket" according to its 1's place

	801		103		255										
	401		323		555										
800	101	512	823		245				018	999					
	901		113												
	121														
0	1	2	3	4	5	6	7	8	9						

RadixSort

- Radix: The base of a number system
 - We'll use base 10, most implementations will use larger bases
- Idea:
 - BucketSort by each digit, one at a time, from least significant to most significant

	801		103		255			018	999
800	401	512	323		555				
	101		823		245				
	901		113						
	121								
0	1	2	3	4	5	6	7	8	9

Place each element into a "bucket" according to its 10's place

800									
801	512	121							
401				245	255				999
101	113	323			555				
901	018	823							
103									
0	1	2	3	4	5	6	7	8	9

RadixSort

0-9 Bucket: $O(n + \frac{n}{b})$

- Radix: The base of a number system
 - We'll use base 10, most implementations will use larger bases
- Idea:
 - BucketSort by each digit, one at a time, from least significant to most significant

800									
801									
401	512	121			255				999
101	113	323		245	555				
901	018	823							
103									
0	1	2	3	4	5	6	7	8	9

Place each element into a "bucket" according to its 100's place

	101							800	
	103							801	901
018	113	245	323	401	512			823	999
	121	255			555				
0	1	2	3	4	5	6	7	8	9

RadixSort

- Radix: The base of a number system
 - We'll use base 10, most implementations will use larger bases
- Idea:
 - BucketSort by each digit, one at a time, from least significant to most significant

018	101 103 113 121	245 255	323	401	512 555			800 801 823	901 999
0	1	2	3	4	5	6	7	8	9

Convert back into an array

018	811	103	113	121	245	255	323	401	512	555	800	801	823	901	999
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

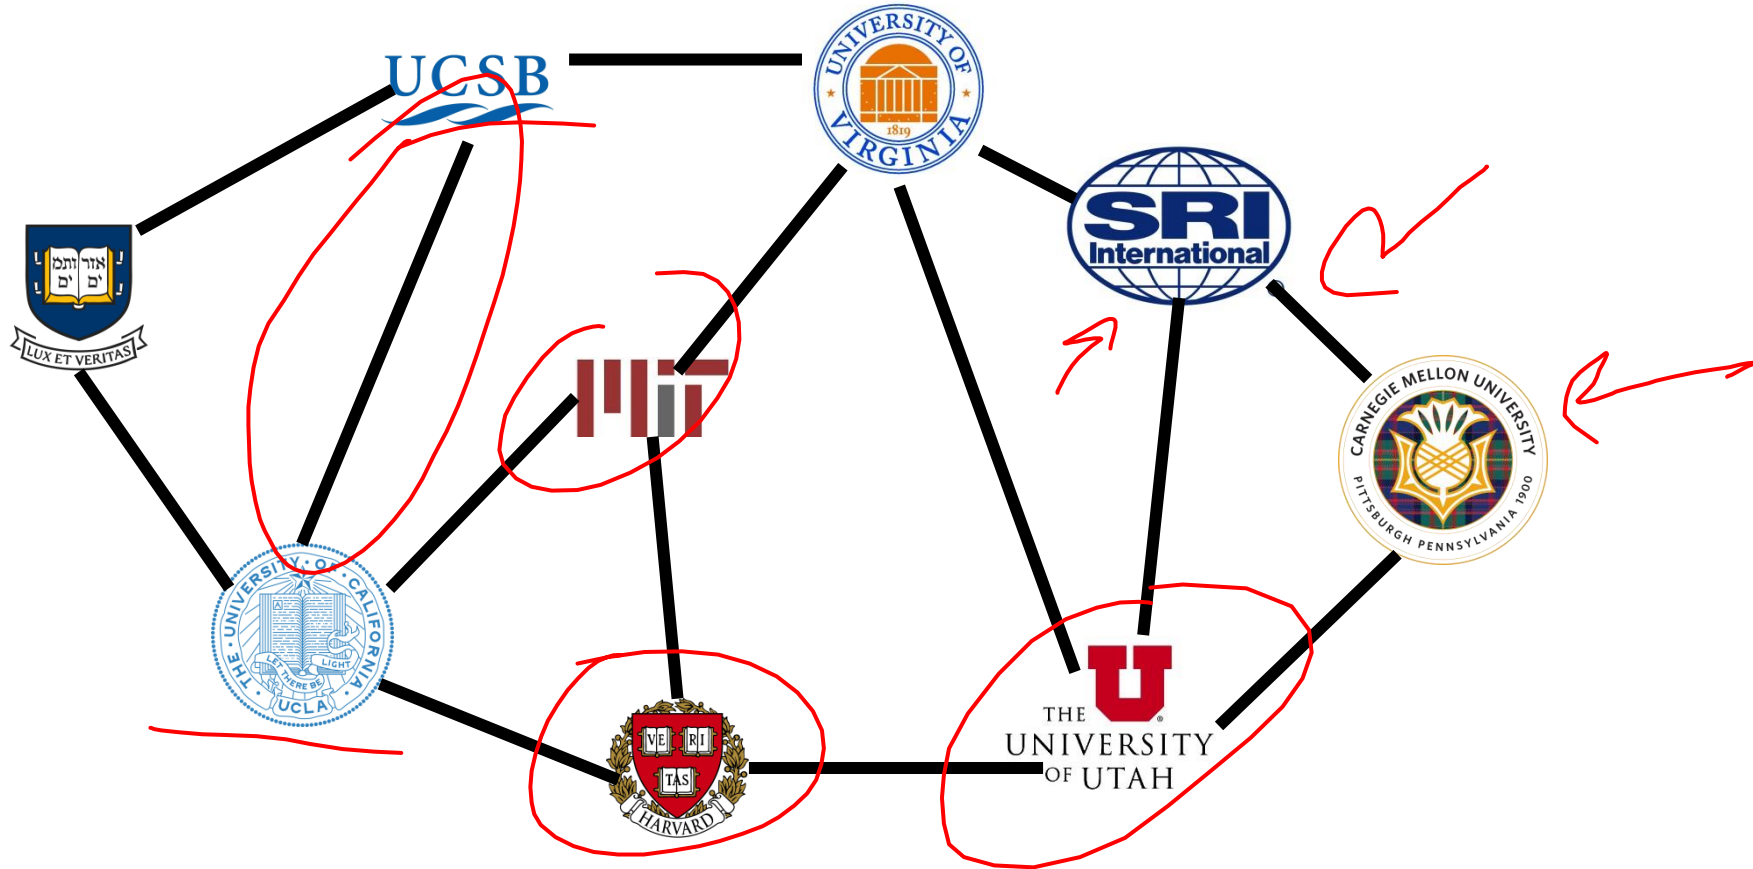

RadixSort Running Time

$$\frac{\Theta(d)(n + b)}{\log_b m}$$

- Suppose largest value is m
- Choose a radix (base of representation) b
- BucketSort all n things using b buckets
 - $\Theta(n + b)$
- Repeat once per each digit
 - $\log_b m$ iterations
- Overall:
 - $\Theta(n \log_b m + b \log_b m)$
- In practice, you can select the value of b to optimize running time
- When is this better than mergesort?

ARPANET

~ ADT

Undirected Graphs

Definition: $G = (V, E)$
Vertices/Nodes
Edges

$V = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}$

$E = \{(1, 2), (2, 3), (1, 3), \dots\}$

Directed Graphs

Definition: $G = (V, E)$
Vertices/Nodes
Edges

$V = \{1,2,3,4,5,6,7,8,9\}$

$E = \{(1,2), (2,3), (1,3), \dots\}$

Self-Edges and Duplicate Edges

Some graphs may have duplicate edges (e.g. here we have the edge (1,2) twice).
Some may also have self-edges (e.g. here there is an edge from 1 to 1).
Graph with Neither self-edges nor duplicate edges are called **simple graphs**

Weighted Graphs

Vertices/Nodes

Definition: $G = (V, E)$

Edges

$w(e)$ = weight of edge e

$V = \{1,2,3,4,5,6,7,8,9\}$

$E = \{(1,2), (2,3), (1,3), \dots\}$

Graph Applications

- For each application below, consider:
 - What are the nodes, what are the edges?
 - Is the graph directed?
 - Is the graph simple?
 - Is the graph weighted?
- Facebook friends
 - Nodes: people, edges: friends relation
 - Directed? No
 - Yes simple
 - depends
- Twitter followers
 - Nodes: people, edges: follows relation
 - Directed? yes
- Java inheritance
- Airline Routes

Some Graph Terms

- Adjacent/Neighbors
 - Nodes are adjacent/neighbors if they share an edge
 - Degree *undirected*
 - Number of “neighbors” of a vertex
 - Indegree
 - Outdegree
- (A red bracket groups Indegree and Outdegree)*
- Number of incoming neighbors
 - Number of outgoing neighbors

Graph Operations

- To represent a Graph (i.e. build a data structure) we need:

- Add Edge

- Remove Edge

- Check if Edge Exists

- Get Neighbors (incoming)

- Get Neighbors (outgoing)

Adjacency List

nodes → neighbors

1	2	3		
2	1	3	5	4
3	1	2	4	6
4	3	5	6	7
5	2	4	7	8
6	3	4	7	
7	5	6	8	9
8	5	7	9	
9	7	8		

Time/Space Tradeoffs

Space to represent: $\Theta(n + m)$

Add Edge: $\Theta(1)$

Remove Edge: $\Theta(1)$

Check if Edge Exists: $\Theta(n)$

Get Neighbors (incoming): $\Theta(n + m)$

Get Neighbors (outgoing): $\Theta(\deg(v))$

$$\begin{aligned} |V| &= n \\ |E| &= m \end{aligned}$$

Adjacency List (Weighted)

Time/Space Tradeoffs

Space to represent: $\Theta(n + m)$

Add Edge: $\Theta(1)$

Remove Edge: $\Theta(1)$

Check if Edge Exists: $\Theta(n)$

Get Neighbors (incoming): $\Theta(?)$

Get Neighbors (outgoing): $\Theta(?)$

$$|V| = n$$

$$|E| = m$$

1	2, 3			
2	1	3	5	
3	1	2	4	6
4	3	5	6	
5	2	4	7	8
6	3	4	7	
7	5	6	8	9
8	5	7	9	
9	7	8		

Adjacency Matrix

1 2 3 4

	A	B	C	D	E	F	G	H	I
A		1	1						
B	1		1		1				
C	1	1		1		1			
D			1		1	1			
E		1		1			1	1	
F			1	1			1		
G					1	1		1	1
H					1		1		1
I							1	1	

Time/Space Tradeoffs

Space to represent: $\Theta(?)$ $\hookrightarrow 2$

Add Edge: $\Theta(?)$

Remove Edge: $\Theta(?)$

Check if Edge Exists: $\Theta(?)$

Get Neighbors (incoming): $\Theta(?)$

Get Neighbors (outgoing): $\Theta(?)$

$$|V| = n$$

$$|E| = m$$

Adjacency Matrix (weighted)

Time/Space Tradeoffs

Space to represent: $\Theta(n^2)$

Add Edge: $\Theta(1)$

Remove Edge: $\Theta(1)$

Check if Edge Exists: $\Theta(1)$

Get Neighbors (incoming): $\Theta(n)$

Get Neighbors (outgoing): $\Theta(n)$

$$|V| = n$$

$$|E| = m$$

	A	B	C	D	E	F	G	H	I
A	/	1	1						
B	1		1		1				
C	1	1		1		1			
D			1		1	1			
E		1		1			1	1	
F			1	1			1		
G					1	1		1	1
H					1		1		1
I							1	1	

Aside

- Almost always, adjacency lists are the better choice
- Most graphs are missing most of their edges, so the adjacency list is much more space efficient and the slower operations aren't that bad

Definition: Path

A sequence of nodes (v_1, v_2, \dots, v_k)
s.t. $\forall 1 \leq i \leq k - 1, (v_i, v_{i+1}) \in E$

Simple Path:

A path in which each node appears at most once

Cycle:

A path which starts and ends in the same place

Definition: (Strongly) Connected Graph

A Graph $G = (V, E)$ s.t. for any pair of nodes $v_1, v_2 \in V$ there is a path from v_1 to v_2

Definition: (Strongly) Connected Graph

A Graph $G = (V, E)$ s.t. for any pair of nodes $v_1, v_2 \in V$ there is a path from v_1 to v_2

Connected

Not (strongly) Connected

Definition: Weakly Connected Graph

A Graph $G = (V, E)$ s.t. for any pair of nodes $v_1, v_2 \in V$ there is a path from v_1 to v_2 ignoring direction of edges

Weakly Connected

Weakly Connected

Definition: Complete Graph

A Graph $G = (V, E)$ s.t. for any pair of nodes $v_1, v_2 \in V$ there is an edge from v_1 to v_2

Complete
Undirected Graph

Complete
Directed Graph

Complete Directed
Non-simple Graph

Graph Density, Data Structures, Efficiency

- The maximum number of edges in a graph is $\Theta(|V|^2)$:
 - Undirected and simple: $\frac{|V|(|V|-1)}{2}$
 - Directed and simple: $|V|(|V| - 1)$
 - Direct and non-simple (but no duplicates): $|V|^2$
- If the graph is connected, the minimum number of edges is $|V| - 1$
- If $|E| \in \Theta(|V|^2)$ we say the graph is **dense**
- If $|E| \in \Theta(|V|)$ we say the graph is **sparse**
- Because $|E|$ is not always near to $|V|^2$ we do not typically substitute $|V|^2$ for $|E|$ in running times, but leave it as a separate variable

Definition: Tree

A Graph $G = (V, E)$ is a tree if it is undirect, connected, and has no cycles (i.e. is acyclic). Often one node is identified as the “root”

A Tree

A Rooted Tree

Breadth-First Search

- Input: a node s
- Behavior: Start with node s , visit all neighbors of s , then all neighbors of neighbors of s , ...
- Output:
 - How long is the shortest path?
 - Is the graph connected?

BFS

Running time: $\Theta(|V| + |E|)$

```
void bfs(graph, s){
    found = new Queue();
    found.enqueue(s);
    mark s as "visited";
    While (!found.isEmpty()){
        current = found.dequeue();
        for (v : neighbors(current)){
            if (! v marked "visited"){
                mark v as "visited";
                found.enqueue(v);
            }
        }
    }
}
```

Shortest Path (unweighted)

Idea: when it's seen, remember its "layer" depth!

```
int shortestPath(graph, s, t){
    found = new Queue();
    layer = 0;
    found.enqueue(s);
    mark s as "visited";
    While (!found.isEmpty()){
        current = found.dequeue();
        layer = depth of current;
        for (v : neighbors(current)){
            if (!v marked "visited"){
                mark v as "visited";
                depth of v = layer + 1;
                found.enqueue(v);
            }
        }
    }
    return depth of t;
}
```

Depth-First Search

Depth-First Search

- Input: a node s
- Behavior: Start with node s , visit one neighbor of s , then all nodes reachable from that neighbor of s , then another neighbor of s ,...
- Output:
 - Does the graph have a cycle?
 - A **topological sort** of the graph.

DFS (non-recursive)

Running time: $\Theta(|V| + |E|)$

```
void dfs(graph, s){
    found = new Stack();
    found.pop(s);
    mark s as "visited";
    While (!found.isEmpty()){
        current = found.pop();
        for (v : neighbors(current)){
            if (! v marked "visited"){
                mark v as "visited";
                found.push(v);
            }
        }
    }
}
```

DFS Recursively (more common)

```
void dfs(graph, curr){  
    mark curr as "visited";  
    for (v : neighbors(current)){  
        if (! v marked "visited"){  
            dfs(graph, v);  
        }  
    }  
    mark curr as "done";  
}
```

Using DFS

- Consider the “visited times” and “done times”

- Edges can be categorized:

- Tree Edge

- (a, b) was followed when pushing
- (a, b) when b was unvisited when we were at a

- Back Edge

- (a, b) goes to an “ancestor”
- a and b visited but not done when we saw (a, b)
- $t_{visited}(b) < t_{visited}(a) < t_{done}(a) < t_{done}(b)$

- Forward Edge

- (a, b) goes to a “descendent”
- b was visited and done between when a was visited and done
- $t_{visited}(a) < t_{visited}(b) < t_{done}(b) < t_{done}(a)$

- Cross Edge

- (a, b) goes to a node that doesn't connect to a
- b was seen and done before a was ever visited
- $t_{done}(b) < t_{visited}(a)$

Cycle Detection

Idea: Look for a back edge!

```
boolean hasCycle(graph, curr){
  mark curr as "visited";
  cycleFound = false;
  for (v : neighbors(current)){
    if (v marked "visited" && ! v marked "done"){
      cycleFound=true;
    }
    if (! v marked "visited" && !cycleFound){
      cycleFound = hasCycle(graph, v);
    }
  }
  mark curr as "done";
  return cycleFound;
}
```

Topological Sort

- A Topological Sort of a **directed acyclic graph** $G = (V, E)$ is a permutation of V such that if $(u, v) \in E$ then u is before v in the permutation

Topological Sort

Idea: List in descending order by “done” time

```
List topologicalSort(graph){
  doneList = new List();
  for (v : graph.vertices()){
    if (! v marked as “seen”){
      topSortRec(graph, v, doneList);
    }
  }
  doneList.reverse();
  return doneList;
}
```

```
void topSortRec(graph, curr, doneList){
  mark curr as “visited”;
  for (v : neighbors(current)){
    if (! v marked “visited”){
      topSortRec(graph, v);
    }
  }
  mark curr as “done”;
  doneList.add(curr);
}
```
