

# CSE 417: Algorithms and Computational Complexity

---

## Dynamic Programming, III

Autumn 2002  
Paul Beame

1

## Three Steps to Dynamic Programming

- Formulate the answer as a recurrence relation or recursive algorithm
- Show that the number of different parameters in the recursive algorithm is "small"
  - e.g., bounded by a low-degree polynomial
- Specify an order of evaluation for the recurrence so that you already have the partial results ready when you need them.

2

## Sequence Comparison: Edit Distance

- Given:**
  - Two strings of characters  $A=a_1 a_2 \dots a_n$  and  $B=b_1 b_2 \dots b_m$
- Find:**
  - The minimum number of edit steps needed to transform  $A$  into  $B$  where an edit can be:
    - insert a single character
    - delete a single character
    - substitute one character by another

3

## Applications

- "diff" utility – where do two files differ
- Version control & patch distribution – save/send only changes
- Molecular biology
  - Similar sequences often have similar origin and function
  - Similarity often recognizable despite millions or billions of years of evolutionary divergence

4

## Recursive Solution

- Sub-problems:** Edit distance problems for **all prefixes** of  $A$  and  $B$  that don't include all of both  $A$  and  $B$
- Let  $D(i,j)$  be the number of edits required to transform  $a_1 a_2 \dots a_i$  into  $b_1 b_2 \dots b_j$
- Clearly  $D(0,0)=0$

6

### Computing $D(n,m)$

- Imagine how best sequence handles the last characters  $a_n$  and  $b_m$
- If best sequence of operations
  - deletes  $a_n$  then  $D(n,m)=D(n-1,m)+1$
  - inserts  $b_m$  then  $D(n,m)=D(n,m-1)+1$
  - replaces  $a_n$  by  $b_m$  then  $D(n,m)=D(n-1,m-1)+1$
  - matches  $a_n$  and  $b_m$  then  $D(n,m)=D(n-1,m-1)$

### Recursive algorithm $D(n,m)$

```

if n=0 then
  return (m)
elseif m=0 then
  return(n)
else
  if  $a_n=b_m$  then
    replace-cost ← 0
  else
    replace-cost ← 1
  } cost of substitution of  $a_n$  by  $b_m$  (if used)
  return(min{  $D(n-1, m) + 1,$ 
              $D(n, m-1) + 1,$ 
              $D(n-1, m-1) + \text{replace-cost}$  })

```

### Dynamic Programming

```

for j = 0 to m; D(0,j) ← j; endfor
for i = 1 to n; D(i,0) ← i; endfor
for i = 1 to n
  for j = 1 to m
    if  $a_i=b_j$  then
      replace-cost ← 0
    else
      replace-cost ← 1
    endif
    D(i,j) ← min {  $D(i-1, j) + 1,$ 
                   $D(i, j-1) + 1,$ 
                   $D(i-1, j-1) + \text{replace-cost}$  }
  endfor
endfor

```

### Example run with AGACATTG and GAGTTA

		A	G	A	C	A	T	T	G
	0	1	2	3	4	5	6	7	8
0									
G	1								
A	2								
G	3								
T	4								
T	5								
A	6								

### Example run with AGACATTG and GAGTTA

		A	G	A	C	A	T	T	G
	0	1	2	3	4	5	6	7	8
V	1	1	1	2	3	4	5	6	7
L	2								
L	3								
L	4								
L	5								
L	6								

### Example run with AGACATTG and GAGTTA

		A	G	A	C	A	T	T	G
	0	1	2	3	4	5	6	7	8
V	1	1	1	2	3	4	5	6	7
L	2	1	2	1					
L	3								
L	4								
L	5								
L	6								

### Reading off the operations

- Follow the sequence and use each color of arrow to tell you what operation was performed.
