   Mathematical Elements for Computer Graphics,
   2<sup>nd</sup> Ed., McGraw-Hill, New York, 1990, Chapter 2.

### Geometric transformations

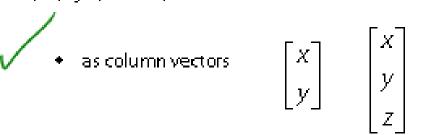

Geometric transformations will map points in one space to points in another: (x', y', z') = f(x, y, z).

These transformations can be very simple, such as scaling each coordinate, or complex, such as non-linear twists and bends.

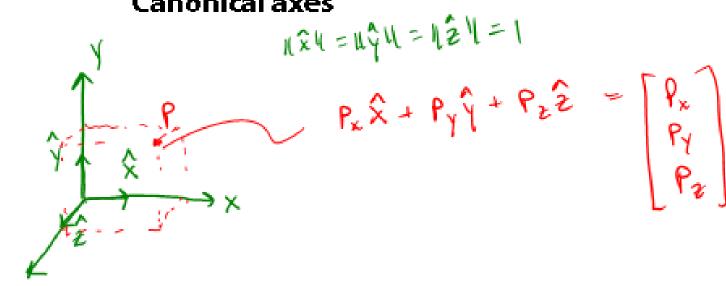

We'll focus on transformations that can be represented easily with matrix operations.

# **Vector representation**

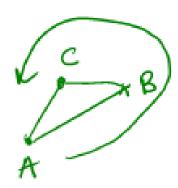

We can represent a **point**,  $\mathbf{p} = (x,y)$ , in the plane or  $\mathbf{p} = (x,y,z)$  in 3D space

### Canonical axes

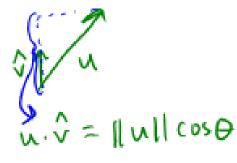

right-handed coord. System

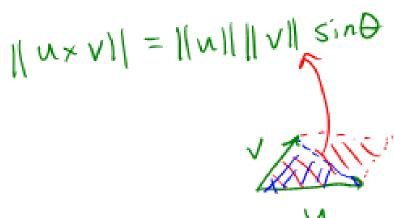

Vector length and dot products

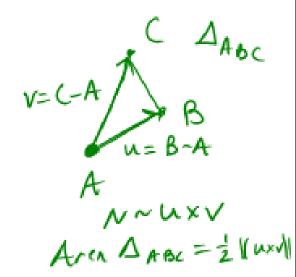

If 
$$||v|| = ||v||^2 + |v||^2 + |v||^2$$

## Vector cross products

WEN TO THE PROPERTY OF THE PRO

# Representation, cont.

We can represent a 2-D transformation M by a m at rix

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix}$$

If **p** is a column vector, M goes on the left:  

$$(A B)^{-1} A^{-1} B^{-1} A^{-1}$$

$$\mathbf{p'} = M\mathbf{p}$$

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} ax + by \\ cx + dy \end{bmatrix}$$

If **p** is a row vector, M<sup>T</sup> goes on the right:

$$\mathbf{p'} = \mathbf{p} \mathcal{M}^T$$

$$[x' \ y'] = [x \ y] \begin{bmatrix} a & c \\ b & d \end{bmatrix} = \begin{bmatrix} ax + by & cx + dy \end{bmatrix}$$

We will use **column vectors**.

### Two-dimensional transformations

Here's all you get with a 2 x 2 transformation matrix. *M*:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

So:

$$x' = ax + by$$

$$y' = cx + dy$$

We will develop some intimacy with the elements a,b,c,d,...

# Identity

Suppose we choose a=d=1, b=c=0:

• Gives the **identity** matrix:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

• Doesn't move the points at all

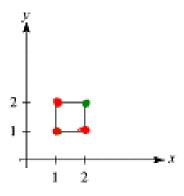

# Scaling

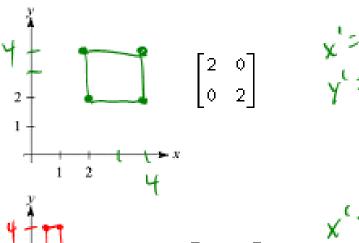

Suppose we set b=c=0, but let a and d take on any positive value:

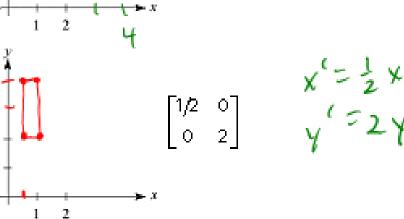

• Gives a scaling matrix:

• Provides **differential (non-uniform) scaling** in *x* and *y*:

$$x' = ax$$
$$y' = dy$$

# Reflection

Suppose we keep b=c=0, but let either a or d go negative.

#### Examples:

$$\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{array}{c} x' = -x \\ 0 & -1 \end{bmatrix} \begin{array}{c} x' = -x \\ y' = -y \end{array}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix} \begin{array}{c} x' = -x \\ y' = -y \end{array}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 0 \\ 0 & -1 \end{bmatrix} = \begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & -1 \\ 0 & -1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & -1 \\ 0 & -1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & -1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & 0 \\ 0 & -1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 \\ 0 & -1 \end{bmatrix}$$

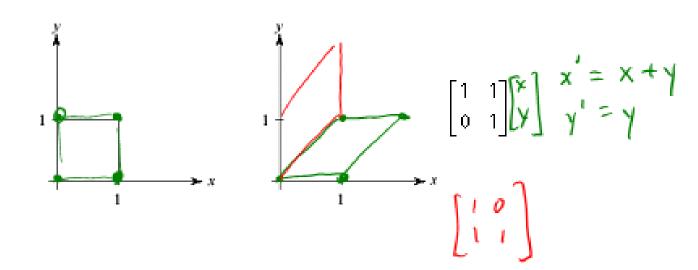

Shew

Now let's leave a=d=1 and experiment with b....

The matrix

gives:

$$x' = x + by$$
$$y' = y$$

### Effect on unit square

Let's see how a general 2 x 2 transformation *M* affects the unit square:

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} \mathbf{p} & \mathbf{q} & \mathbf{r} & \mathbf{s} \end{bmatrix} = \begin{bmatrix} \mathbf{p}' & \mathbf{q}' & \mathbf{r}' & \mathbf{s}' \end{bmatrix}$$

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & a & d + b \\ 0 & c & c + d \\ e' & q' & s' \end{bmatrix}$$

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & a & d + b \\ 0 & c & c + d \\ e' & q' & s' \end{bmatrix}$$

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & a & d + b \\ 0 & c & c + d \\ e' & q' & s' \end{bmatrix}$$

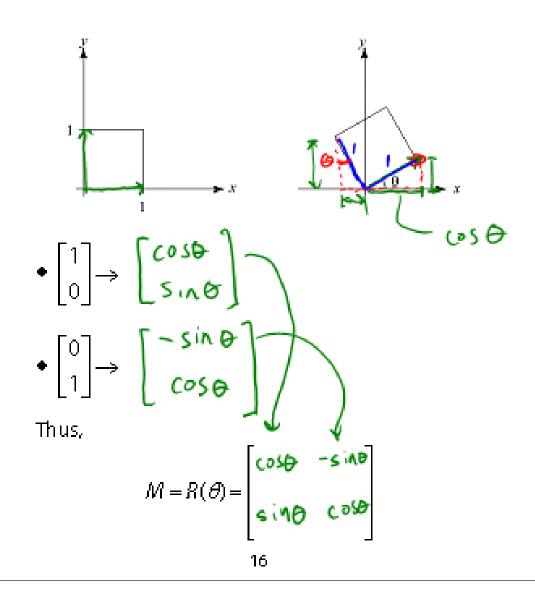

# Effect on unit square, cont.

#### Observe:

- Origin invariant under M
- M can be determined just by knowing how the corners (1,0) and (0,1) are mapped
- a and a give x- and y-scaling
- band c give x-and y-shearing

### Rotation

From our observations of the effect on the unit square, it should be easy to write down a matrix for "rotation about the origin":

### Limitations of the 2 x 2 matrix

A 2 x 2 linear transformation matrix allows

- Scaling
- Rotation
- Reflection
- Shearing

**Q**: What important operation does that leave out?

Translatin

### Homogeneous coordinates

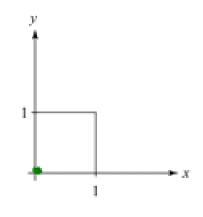

We can loft the problem up into 3-space, adding a third component to every point:

$$\begin{bmatrix} x \\ y \end{bmatrix} \rightarrow \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} \checkmark$$

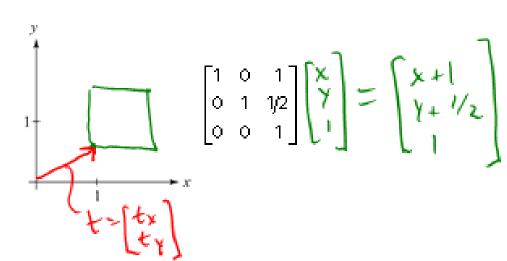

Adding the third "w" component puts us in **homogenous coordinates**.

Then, transform with a 3 x 3 matrix:

$$\begin{bmatrix} x' \\ y' \\ w' \end{bmatrix} = T(\mathbf{t}) \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} x + t_x \\ y + t_y \\ 1 \end{bmatrix}$$

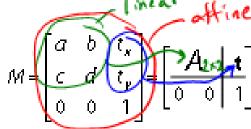

... gives **translation**!

### Affine transformations

The addition of translation to linear transformations gives us affine transformations.

In matrix form, 2D affine transformations always look like this:

2D affine transformations always have a bottom row of [0.0.1].

An "affine point" is a "linear point" with an added wcoordinate which is always 1: MPAH OUT Prin

$$\mathbf{p}_{\mathsf{aff}} = \begin{bmatrix} \mathbf{p}_{\mathsf{lin}} \\ 1 \end{bmatrix} = \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Applying an affine transformation gives another affine point:

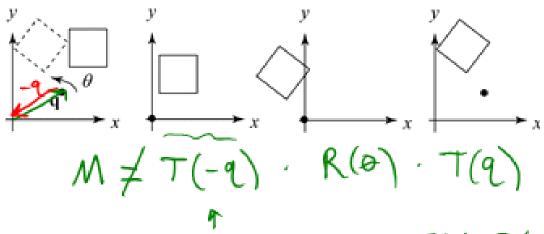

$$M\mathbf{p}_{\mathsf{aff}} = \begin{bmatrix} A\mathbf{p}_{\mathsf{lin}} + \mathbf{t} \\ 1 \end{bmatrix}$$

## Rotation about arbitrary points

Until now, we have only considered rotation about the origin.

R(6) T(4)

With homogeneous coordinates, you can specify a rotation,  $\theta$  about any point  $\mathbf{q} = [q_x q_y 1]^T$  with a matrix:

1. Translate **q** to origin

- 2. Rotate
- 3. Translate back

Note: Transformation order is important!!

### Points and vectors

Vectors have an additional coordinate of w=0. Thus, a change of origin has no effect on vectors.

**Q**: What happens if we multiply a vector by an affine matrix?

$$Mv = \begin{bmatrix} a & b & t_x \\ c & d & t_y \\ o & 0 & 1 \end{bmatrix} \begin{bmatrix} v_x \\ v_y \\ o \end{bmatrix} = \begin{bmatrix} av_x + bv_y \\ c & v_x + dv_y \\ 0 & 0 \end{bmatrix}$$

 $A = \begin{bmatrix} B_x - A_x \\ B_y - A_y \end{bmatrix}$ These representations reflect some of the rules of affine operations on points and vectors:

One useful combination of affine operations is:

$$\mathbf{p}(t) = \mathbf{p}_0 + t\mathbf{u}$$

21

Q: What does this describe?

**Q**: What do

V = [vx]

B+t

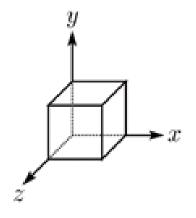

### Basic 3-D transformations: scaling

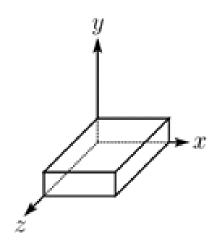

Some of the 3-D affine transformations are just like the 2-D ones.

In this case, the bottom row is always [0 0 0 1].

For example, scaling:

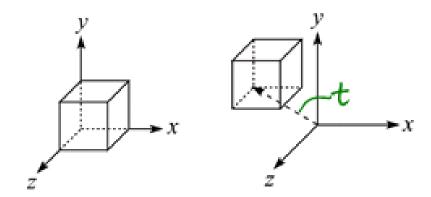

$$\begin{bmatrix} x' \\ y' \\ z' \end{bmatrix} = \begin{bmatrix} s_x & 0 & 0 & 0 \\ 0 & s_y & 0 & 0 \\ 0 & 0 & s_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix}$$

### Translation in 3D

$$\begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & t_x \\ 0 & 1 & 0 & t_y \\ 0 & 0 & 1 & t_z \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

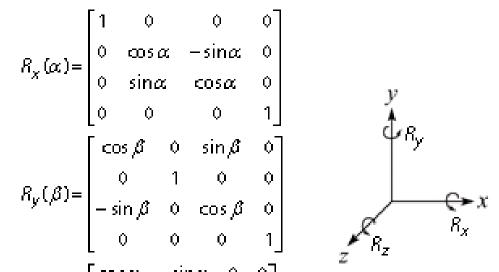

### Rotation in 3D

Rotation now has more possibilities in 3D:

$$R_{\chi}(\alpha) = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos \alpha & -\sin \alpha & 0 \\ 0 & \sin \alpha & \cos \alpha & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$R_{y}(\beta) = \begin{bmatrix} \cos \beta & 0 & \sin \beta & 0 \\ 0 & 1 & 0 & 0 \\ -\sin \beta & 0 & \cos \beta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$R_{z}(y) = \begin{bmatrix} \cos y & -\sin y & 0 & 0 \\ \sin y & \cos y & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Use right hand rule

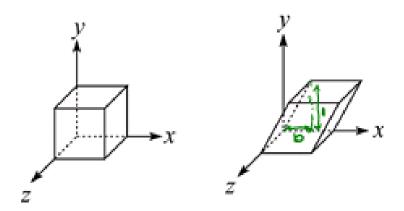

A general rotation can be specified in terms of a prodout of these three matrices. How else might you specify a rotation?

# Shearing in 3D

Shearing is also more complicated. Here is one

example:

$$\begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & b & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

We call this a shear with respect to the x-z plane.

# Properties of affine transformations

Here are some useful properties of affine transformations:

- Lines map to lines
- Parallel lines remain parallel
- Midpoints map to midpoints (in fact, ratios are always preserved)

ratio = 
$$\frac{\|\mathbf{p}\mathbf{q}\|}{\|\mathbf{q}\mathbf{r}\|} = \frac{s}{t} = \frac{\|\mathbf{p}'\mathbf{q}'\|}{\|\mathbf{q}'\mathbf{r}'\|}$$

## Affine transformations in OpenGL

OpenGL maintains a "modelview" matrix that holds the current transformation **M.** 

The modelview matrix is applied to points (usually vertices of polygons) before drawing.

It is modified by commands including:

• glTranslatef(
$$t_x$$
,  $t_y$ ,  $t_z$ )  $M \leftarrow MT$   
- translate by  $(t_x, t_y, t_z)$ 

• glRotatef(
$$\theta$$
, x, y, z)  $\mathbf{M} \leftarrow \mathbf{MR}$   
- rotate by angle  $\theta$  about axis (x, y, z)

\* glScalef(
$$s_x$$
,  $s_y$ ,  $s_z$ )  $\mathbf{M} \leftarrow \mathbf{MS}$   
- scale by  $(s_x, s_y, s_z)$ 

Note that OpenGL adds transformations by postmultiplication of the modelview matrix.

### Summary

What to take away from this lecture:

- All the names in boldface.
- How points and transformations are represented.
- How to compute lengths, dot products, and cross products of vectors, and what their geometrical meanings are.
- What all the elements of a 2 x 2 transformation matrix do and how these generalize to 3 x 3 transformations.
- What homogeneous coordinates are and how they work for affine transformations.
- How to concatenate transformations.
- The mathematical properties of affine transformations.
