Computational Geometry
Convex Hull
Line Segment Intersection
Voronoi Diagram

Geometric Algorithms

- Algorithms about points, lines, planes, polygons, triangles, rectangles and other geometric objects.
- Applications in many fields
 - robotics, graphics, CAD/CAM, geographic systems

CSE 521 - Computational Geometry - Spring 2003

2

Convex Hull in 2-dimension

- Given n points on the plane find the smallest enclosing curve.

CSE 521 - Computational Geometry - Spring 2003

3

Convex Hull in 2-dimension

- The convex hull is a polygon whose vertices are some of the points.

CSE 521 - Computational Geometry - Spring 2003

4

Definition of Convex Hull Problem

- Input:
Set of points p_1, p_2, \dots, p_n in 2 space. (Each point is an ordered pair $p = (x, y)$ of reals.)
- Output:
A sequence of points $p_{i_1}, p_{i_2}, \dots, p_{i_k}$ such that traversing these points in order gives the convex hull.

CSE 521 - Computational Geometry - Spring 2003

5

Example

Input: $p_1, p_2, p_3, p_4, p_5, p_6, p_7, p_8, p_9, p_{10}, p_{11}, p_{12}$
Output: $p_6, p_1, p_2, p_{11}, p_{12}, p_{10}$

CSE 521 - Computational Geometry - Spring 2003

6

Slow Convex Hull Algorithm

- For each pair of points p, q determine if the line from p to q is on the convex hull.

CSE 521 - Computational Geometry - Spring 2003

7

Slow Convex Hull Algorithm

- For each pair of points p, q , form the line that passes through p and q and determine if all the other points are on one side of the line.
 - If so the line from p to q is on the convex hull
 - Otherwise not
- Time Complexity is $O(n^3)$
 - Constant time to test if point is on one side of the line from (p_1, p_2) to (q_1, q_2) .

$$0 = (q_2 - p_2)x + (p_1 - q_1)y + p_2q_1 - p_1q_2$$

CSE 521 - Computational Geometry - Spring 2003

8

Graham's Scan Convex Hull Algorithm

- Sort the points from left to right (sort on the first coordinate in increasing order)

CSE 521 - Computational Geometry - Spring 2003

9

Convex Hull Algorithm

- Process the points in left to right order

CSE 521 - Computational Geometry - Spring 2003

10

Convex Hull Algorithm

- Right Turn

39

Convex Hull Algorithm

- Left Turn – back up

CSE 521 - Computational Geometry - Spring 2003

40

Convex Hull Algorithm

- Done!

CSE 521 - Computational Geometry - Spring 2003

41

Co-linear Points

- Not a left turn
 - Middle point is **included** in the convex hull

CSE 521 - Computational Geometry - Spring 2003

42

Vertical Points

- Sort
 - First **increasing** in x
 - Second **decreasing** in y

CSE 521 - Computational Geometry - Spring 2003

43

Testing For Left Turn

- Slope **increases** from one segment to next

$$\text{left turn } \frac{q_2 - p_2}{q_1 - p_1} < \frac{r_2 - q_2}{r_1 - q_1}$$

$(q_2 - p_2)(r_1 - q_1) < (r_2 - q_2)(q_1 - p_1)$ to avoid dividing by zero

CSE 521 - Computational Geometry - Spring 2003

44

Time Complexity of Graham's Scan

- Sorting – $O(n \log n)$
- During the scan each point is “visited” at most twice
 - Initial visit
 - back up visit (happens at most once)
- Scan – $O(n)$
- Total time $O(n \log n)$
- This is best possible because sorting is reducible to finding convex hull.

CSE 521 - Computational Geometry - Spring 2003

45

Notes on Convex Hull

- $O(n \log n)$
 - Graham (1972)
- $O(n h)$ algorithm where h is the size of hull
 - Jarvis' March, “Gift wrapping” (1973)
 - Output sensitive algorithm
- $O(n \log h)$ algorithm where h is size of hull
 - Kirkpatrick and Seidel (1986)
- d -dimensional Convex Hull
 - $\Omega(n^{d/2})$ in the worst case because the output can be this large.

CSE 521 - Computational Geometry - Spring 2003

46

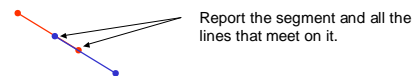

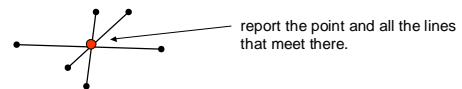

Line Segment Intersection Problem

CSE 521 - Computational Geometry - Spring 2003

47

Special cases

CSE 521 - Computational Geometry - Spring 2003

48

Polygon Intersection

- Polygons have no self intersections

Use line segment intersection to solve polygon intersection

CSE 521 - Computational Geometry - Spring 2003

49

Polygon Intersection

- What if no line segment intersections?

CSE 521 - Computational Geometry - Spring 2003

50

Polygon Intersection

- Intersect a ray from each polygon with the other
 - Inside, if ray has an odd number of intersections, otherwise outside. Jordan curve theorem (1887).

CSE 521 - Computational Geometry - Spring 2003

51

Issues

- With n line segments there may be $O(n^2)$ intersections.

- Goal: Good output sensitive algorithm
 - $O(n \log n + s)$ would be ideal where s is the number of intersections.

CSE 521 - Computational Geometry - Spring 2003

52

Plane Sweep Algorithm

- Sweep a plane vertically from top to bottom maintaining the set of known future events.
- Events
 - Beginning of a segment
 - End of a segment
 - Intersection to two "adjacent" segments

CSE 521 - Computational Geometry - Spring 2003

53

Segment List

- We maintain ordered list of segments

segment ordering at $y = c, d, f, b, e, a$

CSE 521 - Computational Geometry - Spring 2003

54

Key Idea in the Algorithm

- Just before an intersection event the two line segments must be **adjacent** in the segment order.
- When a **new adjacency** occurs between two lines we must check for a possible new intersection event.

Initialization

- Event Queue**
 - contains all the beginning points and all the end points of segments ordered by decreasing y value.

Event Queue
 $b_a, b_b, b_c, b_d, e_d, b_e, e_b, e_e, e_a, e_c$

- Segment List**
 - Empty

Algorithm

- Remove the next event from the event queue

begin segment event

- Insert b into the segment list between a and c
- Check for intersections with adjacent segments (a,b) and (b,c), and add any to event queue

end segment event

- Delete b from the segment list
- Check for intersections with adjacent segments (a,c), and add any to event queue

Algorithm

intersection event event

- Reverse the order of b and c on the segment list
- Check for intersections with adjacent segments (a,c) and (b,d) and add any to event queue

Complications

- Several events can coincide.

■ begin segment event
■ end segment event
■ intersection event

do in left to right order

- Horizontal lines

Example

Event Queue

CSE 521 - Computational Geometry - Spring 2003 74

Data Structures

- Event List
 - Priority queue ordered by decreasing y, then by increasing x
 - Delete minimum, Insertion
- Segment List
 - Balanced binary tree search tree
 - Insertion, Deletion
 - Reversal can be done by deletions and insertions
- Time per event is $O(\log n)$

CSE 521 - Computational Geometry - Spring 2003 75

Finding Line Segment Intersections

- Given line segments $(p_1, p_2), (q_1, q_2)$ and $(r_1, r_2), (s_1, s_2)$ do they intersect, and if so where.
- Where? Solve
 - $0 = (q_2 - p_2)x + (p_1 - q_1)y + p_2q_1 - p_1q_2$
 - $0 = (s_2 - r_2)x + (r_1 - s_1)y + r_2s_1 - r_1s_2$
- If?
 - (p_1, p_2) and (q_1, q_2) on opposite sides of line $(r_1, r_2), (s_1, s_2)$ and
 - (r_1, r_2) and (s_1, s_2) on opposite sides of line $(p_1, p_2), (q_1, q_2)$

CSE 521 - Computational Geometry - Spring 2003 76

Opposite Sides

CSE 521 - Computational Geometry - Spring 2003 77

Notes on Line Segment Intersection

- Total time for plane sweep algorithm is $O(n \log n + s \log n)$ where s is the number of intersections.
 - $n \log n$ for the initial sorting
 - $\log n$ per event
- Plane sweep algorithms were pioneered by Shamos and Hoey (1975).
- Intersection Reporting - Bentley and Ottmann (1979)

CSE 521 - Computational Geometry - Spring 2003 78

Voronoi Diagram

Each site defines an area of points nearest to it. Boundaries are perpendicular bisectors.
<http://www.cs.cornell.edu/info/People/chew/Delaunay>

CSE 521 - Computational Geometry - Spring 2003 79

Brute Force

- Each Voronoi area is the intersection of half spaces defined by perpendicular bisectors.

$O(n^2 \log n)$ time

CSE 521 - Computational Geometry - Spring 2003 80

Linear Size of Voronoi Diagram

- The Voronoi Diagram is a planar embedding so it obeys Euler's equation $V - E + F = 2$

Vertices = 7 (single vertex at infinity)
Edges = 11
Faces = 6

CSE 521 - Computational Geometry - Spring 2003 81

Linear Size of Voronoi Diagram

- $F = E - V + 2$ (Euler's equation)
- $n = F$ (one site per face)
- $2E \geq 3V$ because each vertex is of degree at least 3 and each edge has 2 vertices.
- $n \geq 3V/2 - V + 2 = V/2 + 2$
- $2n - 2 \geq V$
- $n > E - (2n - 2) + 2$
- $3n - 4 \geq E$

CSE 521 - Computational Geometry - Spring 2003 82

Properties Voronoi Diagram

- A vertex is the center of a circle through at least three sites

CSE 521 - Computational Geometry - Spring 2003 83

Properties Voronoi Diagram

- A point on a perpendicular bisector of sites p and q is on an edge if the circle centered at the point through p and q contains no other sites.

CSE 521 - Computational Geometry - Spring 2003 84

Fortune's Sweep

- We maintain a “beach line,” a sequence of parabolic segments that is the set of point equidistant from a site and the sweep line.
- Events
 - Site event – new site is encountered by the sweep line
 - Circle event – new vertex is inserted into the Voronoi diagram

CSE 521 - Computational Geometry - Spring 2003

85

a, b, a, c, a

event queue
 $C_{(b,a,c)}$

Example

beach line
a, b, c, a

event queue

Example

beach line
a, b, c, a

event queue

Event Queue

- Contains site events and circle events sorted by y in decreasing order, then by x in increasing order
- Circle events can be both inserted and deleted.

Beach Line

- Implemented as a balanced binary search tree.
 - sites at leaves
 - breakpoints at internal nodes

CSE 521 - Computational Geometry - Spring 2003

97

Output

- For each site output the vertices in clockwise order. When a circle event occurs add to the vertex list of the three (or more) sites.

CSE 521 - Computational Geometry - Spring 2003

98

Complexity

- Number of segments in the beach line $\leq 2n$
 - Each site event adds at most 2 segments.
- Number of circle event insertions $\leq 2n$
 - Each site event creates at most 2 circle events.
- Time per event is $O(\log n)$
 - Insert new segments into the segment tree.
 - Insert new circle events into the event queue
 - Delete circle events from the event queue
- Total time is $O(n \log n)$

CSE 521 - Computational Geometry - Spring 2003

99

Voronoi Diagram Notes

- Voronoi diagram
 - Dirichlet (1850), Voronoi (1907)
- $O(n \log n)$ algorithm
 - Divide and conquer - Shamos and Hoey (1975)
 - Plane sweep - Fortune (1987)

CSE 521 - Computational Geometry - Spring 2003

100

Exercise

- Give an $O(n \log n)$ algorithms which given a set of n points on the plane, for each point finds its nearest neighbor.

CSE 521 - Computational Geometry - Spring 2003

101
